

PEARS CYCLOPAEDIA

1971-72

A BOOK OF BACKGROUND INFORMATION
AND REFERENCE FOR EVERYDAY USE

EDITOR
L. MARY BARKER
B.Sc.LOND.

Eightieth edition

The Editor desires to express her gratitude to readers for their criticisms and suggestions and to all those who in one way or another have contributed to the making of this edition. Correspondence should be addressed to the Editor at 'Middlemarch',
Halstead, Sevenoaks, Kent.

First published 1897

CONTENTS

	<i>Index</i>	<i>page v</i>
1	Events	A 1-36
2	Prominent People	B 1-66
3	Background to Public Affairs	C 1-42
4	The Law of England	D 1-48
5	The World of Music	E 1-26
6	The World of Science	F 1-66
7	Background to Economic Events	G 1-42
8	Greek Myths and Legends	H 1-38
9	The Contemporary Theatre	I 1-40
10	Ideas and Beliefs	J 1-54
11	Gazetteer of the World	K 1-190
12	General Information	L 1-128
13	Literary Companion	M 1-56
14	General Compendium	N 1-20
15	Medical Matters	P 1-68
16	Introduction to Psychology	Q 1-30
17	Modern Gardening	T 1-36
18	Games and Recreations	U 1-36
19	Domestic Pets	Z 1-23
20	Atlas of the World	<i>plates</i> 1-32

INDEX

Some of the sections are alphabetically arranged and index themselves. Their contents are not included here except where it is anticipated some special difficulty in reference may arise. Each section has a letter and, where appropriate, the column is given in brackets after the page number e.g. F8(1), G26(2). The sections "Greek Myths and Legends", "Medical Matters" and "The World of Music" have each a separate index and glossary.

	PAGE		PAGE
Abbreviations	M49-56	Average, defined	L11
ABM defence system	C20	Avogadro's hypothesis	L11, F21(2)
Absolute temperature	L2	B	
Acids and bases	F22-3	Bacteria	F39(1), P7(1)
Administration of Justice Act 1970	D8(1), D5(1)	bacterial diseases in man	P12
Adoption of children	D38-41	bacterial diseases in plants	T31
Houghton Committee's proposals	D40(2)	Balance of payments, defined	G5(1), G28(1)
Africa organisations	C41	table 1960-70 (in new form of presentation)	G29
See also Nigeria, Rhodesia, South Africa		Balance of power	L11
Age of majority	D12(1), C8(1)	Balance of trade defined	G7(1)
Aid to underdeveloped countries	G26-8	Bank rate	G21(1), G22, G41(2)
Air composition	L3	Baryons	F14
pollution	L93	Bats	L13
Alchemy	J3	Battery, electric	L13
Alpha-rays (or particles)	L4, F11(1)	See also Fuel cells, Solar batteries	
Alpha rhythm	Q5(2)	Bauhaus	L14
America's Cup	L4, U32(2)	Bayeux tapestry	L14
Americas organisations of the	C41	Beat generation	J7
Amino acids	L5, F27(1)	Beaufort scale of wind force	N10
Ampere, defined	L5	Behaviourist school of psychology	J7, Q9(2), Q18
Andromeda nebula	F4(2), F7	Beta-rays (or particles)	F11(1)
Animal kingdom	F32-9	Bible	L15
Antarctic exploration	L6	Binary notation	L15
Anthropology, physical	F47-51	See also Bit	
(tracing and dating the development of man, the races of man, anthropometry, physiometry, attributes of the blood)		Biological warfare	L15
Anthropology, social	F51-4	Biology	F26-47
(the notion of roles, kinship and marriage, authority systems, economic systems, religion, social change)		(the cell: cytoplasm and nucleus, multicellular organisation, classification and physiology of animals and plants, geological record and evolution, ecology)	
Antineutrino	F14, F16(2)	Birds	F33(2), L15
Antiparticles	F16(1)	bird watching	U19
Antiproton	L6, F14, F16(1)	cage birds	Z21
Antisemitism	J4	Birth control	P56
Apostles	L7	Papal encyclical <i>Humanae Vitae</i>	J38(1)
Arabic numerals	L7	Bit	L16
Arab-Israeli war (1967)	C12(2)	Black death	L16
Arab League	C41	Black power	J7
Arctic exploration	L8	Blood, function of	F36, P24
Arrest, powers of	D11(1)	Blood groups	F50(1), P64
Asia organisations	C41	Body temperature	P68
See also China, India, Pakistan, Vietnam		See also Infectious diseases	
Asteroids	L9, F3(2)	Books classification	L17
Astronomers Royal (since 1875)	L10	standard sizes	N3
Astronomical distances	F7	Brain and nervous system	F37, P46
Astronomical unit, defined	L9	drugs acting on the brain	P23
Astronomy outline	F3-7	infantile undernutrition	P57-9
(galaxies and stars, solar system, origin of universe, quasars and pulsars)		injuries to the head	P19
Atmosphere, earth's	L10	See Section Q as to how the brain gathers and decodes information	
See also Aurora, Ionosphere, Van Allen belts		Brandt, Willy	C10(2)
Atomic bomb	F12(1)	Breeder reactor	L17
nucleus	F10(2)	Brezhnev, Leonid	C11(2)
number	F10(2), F20(1), F66	British Association	L18
particles	F13	British Commonwealth, see Commonwealth	
weight	F10(2), F21, F66	British constitution	C21
Atoms	F9(2), F12(2), F20(1)	British monarchs	N4
Attlee, Clement	C3, C4, C5	British prime ministers	N5
Aurora polaris	L10	British Rail	L18
		British Standard Time	L18
		Brussels Treaty	C37(2)

	PAGE
Buddhism	J8
Budget explanation	G24(2)
Budgets 1960-71	G40-2
Burns and scalds treatment	P21(2)
By-elections, 1945-70	C7
C	
Cabinet, as head of government structure	C23(1)
members of Heath administration	C42
Calendar information	N10-11, last page
Calorie, defined	L19
nutritional	P40
Canaries, care of	Z22
Candela, defined	L20 N7
Capital gains	G15(2)
tax imposed (1965)	G15(2), G40(2)
See also Tax reforms, G42(1)	
Carbohydrates	F27(1)
See Diet	
Cardinals	L20
Cats care of	Z9-11
Cell fundamental unit of life	F26-32
cytoplasm	F27
nucleus	F30
(diagrams illustrating genetic code and double helical DNA molecule)	
Central Government outline	C21-6
(Structure The Queen, Parliament, The Executive, The Judiciary Reform of Government The Working of Government 1970)	
Ceramics	L22
See also China Marks	
Chain reaction nuclear	F12(1)
See also Fission	
Channel tunnel	L22
Chemistry	F20-6
(electron shells and stability, molecules, ions and bonds, metals and salts, acids and bases, the hydrogen bond and water, chemical reactions, catalysis, organic chemistry, technical applications)	
Children and Young Person's Act 1969	D41-3
China	C15-16
China marks Chinese, English and Continental	N15-20
Chlorophyll	L23
See also Photosynthesis	
Chomsky and psycholinguistics	Q29(2)
Christianity	J10
Chromosomes	L23, F30
Churchill, Sir Winston, retirement from politics	C5(1)
Circulation of the blood	P26-7, F35-6
Civil Law	D13-19
Civil List	L24
Civil Service	C23-4
Fulton proposals for reform	C23(2)
Clouds	L24
Coal	L24
Colombo Plan	C41
Colonies, British	K190
See also Commonwealth	
Colour vision	Q8
Comets	L26
Commission on Industrial Relations	C25(2)
Common Law	D7
Common Market	G9(2), C38(2)
applications for membership	G34-5
political aspects	C39-40
Commons, House of	C22
Committees of the House	C22-3
state of the parties 1970	C7
Commonwealth outline	C30-4
Commonwealth conferences	C31, C32, C33

	PAGE
Communism	J12
Computer research	Q29(2), Q23(1)
Conservative Party general election results 1945-70	C7
Heath's administration	C42
Constitution, British	C21(1)
Commission on	C25(1)
Continental drift	L26, F8-9
See also Plate tectonics	
Contraception	P56
Corporation tax	G40(2)
See also Tax reforms, G42(1)	
Cosmic rays	L27, F3(2)
Cosmology modern theories	L27 F3-7
Cost-of-living index	G18(1)
Coulomb, defined	L28
Council of Europe	C38-9
Country code	N10
Country parks, see National parks	
Countryside Act 1968	C8(1)
Courts of Law in England and Wales	D4-6
See also Juvenile Courts	
Crab nebula	F4(1)
Criminal Law	D9-11
abolition of the death penalty	D10(1), C26(1)
Criminal Courts	D6
Criminal Justice Act 1967	D10
Criminal Law Act 1967	D10-11
overcrowding in prisons	D47
Curie, defined	L29
Currencies, foreign	N9
Cryogenics	L28
Cytoplasm and genetic activity	F27-30
Czechoslovakia	C11-13
D	
Dalton and atomic theory	F10(1)
Dadaism	L29
Darwin and evolution	F46
Day, longest and shortest	N10
Dead Sea scrolls	L30
Death duties, see Estate duty	
Death watch beetle	L30
Deflation	L30, G9(1)
De Gaulle	C9-10
Democratic Party (USA)	L30, C19(1)
Determinism and free-will	J13
Devaluation of sterling	G30(2)
Developing countries, see Underdeveloped countries	
Diet	P40-1
basic constituents	P40(1)
calories	P40(2)
obesity	P41(1)
weight/height tables	P41
Dirac relativity and quantum theory	F16(1)
Divorce legal notes	D11(2), D30-4
Divorce Reform Act 1969	D30(2)
DNA and RNA and the genetic code	F31
Dogs, care of	Z2-9
Doppler effect	F5(1)
Drama modern playwrights, see Section I	
Dramatic terms, glossary of	F9-11
Drug abuse and drug dependence	F22-4
E	
Ear and auditory perception	Q12(2), F65(2)
Earth	F8-9, L34
(structure, age of rocks, continents and the ocean floor See also Atmosphere, Moon, Solar system, Plate tectonics)	
Earthquake	L34
Ecology	F41-4
(abiotic factors, biotic factors, population dynamics)	
Ecumenism	J15

	PAGE		PAGE
Education economic aspect	G23-4	Fundamentalism	J21
historical sketch	J15-16	Fungi	F39(2)
EEC (European Economic Community)		Fusion nuclear	L85
Britain's applications to join	G8(2), C38(2)	in stars	F6(2)
Commission	G34-5	<i>See also</i> Plasma physics	
Council of Ministers	C40(1)	Galaxies and stars	F3-7
historical background	C40(1)	Gamma rays	F11(1)
Werner Plan (economic and monetary union)	C37-9	Gandhi, Indira	C13, C14
EFTA (European Free Trade Association)	G35(1), C40(2)	Garden paths weed control	T33(2)
	G9(2), C39(1)	GATT	G9(1)
Einstein and photons	F13(1)	Gauss, defined	L46
relativity theories	F15	Geiger counter	L46, F3(2)
ELDO (European Space Vehicle Launcher Development Organisation)	C40-1	General election results 1945-70	C7
Electrical units, <i>see</i> SI units,		Genes	L46, F30(2), F50(2)
<i>also</i> Section L under their names		<i>See also</i> Heredity	
Electricity	F18-19	Genetic code	F29(2) F31(2)
Electromagnetic waves	F13(1)	Geological time scale	F44
Electron	F10(2), F14	George VI death of	C4-5
electron shells and stability	F20	Gerbils	Z18
valence electrons	F20(2), F21(1)	Germany, after Second World War	C37-8
Electron microscope	F27(2), L36	Germany, West (Federal Republic of)	C10
Electronvolt, defined	L36	Gestalt school of psychology	J27, Q9(2)
Elements	L36, F10(1), F66	Gold crisis 1968	G32(2)
and compounds	F20	Gold standard	L48
atomic weights	F66	Gospels	L49
valencies	F66	Government Central outline	C21-6
Elizabeth II, Queen as constitutional monarch	C21(2)	(structure, reform of government, working of government 1970)	
coronation	C5(1)	Government, Local outline	C26-30
Emotion	Q25	(local government in Greater London proposals for reform England Scot land, Wales, Northern Ireland)	
Energy conversion	L37	Gram molecular weight	F21(2)
<i>See also</i> Nuclear energy		Gramophone records	F62-5
Energy-mass equivalence	F15(1)	Gravitation	F15(2)
English language	M44	Greater London Council	C27
English law	D1-48	Greece	C10(2)
English verse forms	M30-7	Greek alphabet	N9
Enzymes	L37, F30(1), F25(1)	Greek art, <i>see</i> Hellenic art	L50
Estate duty	L38 G15	Green Paper, defined	C22(1)
<i>See also</i> Tax reforms, G42(2)		Gulf stream	L50
Euratom	C40(2)	Gypsies	L51
Eurodollar market	L38, G33(2)	Haemorrhage and shock	P20(1)
European Community, <i>see</i> EEC		Half-life radioactivity	F11(1)
Everest expeditions	L38	Hallmarks	L52
Evolution of organisms	F45-7, L39	London silver marks	N12-14
<i>See also</i> Multicellular organisation		provincial silver marks	N12, 13
Exchange rate, defined	G8(2)	Scottish and Irish	N14
Exchange rates in relation to £	N9	Hallucinogens	L52
Existentialism	J18	Hapsburgs	L58
Extra-sensory perception	Q14(2)	Heat	L53, F17
Eye and visual perception	Q7-12	latent heat	L69
Fabian Society	J18	mechanical equivalent	F17(2)
Family Law Reform Act 1969	D86(1)	<i>See also</i> Joule, Thermodynamics	
Fauvism	L41	Heisenberg's uncertainty principle	F15(1)
Feedback cult	J19	Helium	L54
Fertilisers	T26-8	in sun and stars	F4(1), F6(2)
Feudalism	J20	Heredity	L55
Figures of speech	M38-9	interplay with environment	Q27(2)
First aid principles, <i>see</i> Physical injuries		Mendelian genetics	F47
Fish	F38(2)	<i>See also</i> Genes

HISTORICAL EVENTS

Chronicle of events from the earliest times to the present day For events in pre-history the reader may also like to consult the Geological Time Scale in Part IV and the subsection "The Earliest Men and their Dates" in Part V of the Science Section

CHRONICLE OF EVENTS

Note — For classical history and for the past millennium most dates are well established For other periods there is sometimes considerable uncertainty Many of the dates in ancient history are either dubious or approximate sometimes both

B C PREHISTORY

5 000 000 000	Age of Earth
3 300 000 000	Earliest known rocks (found in Rhodesia and Manitoba)
2 000 000 000	Life appears
600,000 000	First large scale occurrence of fossils
30 000 000	Earliest ape fossils (Oligocene period—Fayum Egypt)
20 000 000	Early ape fossils (Miocene period—Proconsul E Africa)
1 700 000	Earliest known hominids (Lower Pleistocene— <i>Australopithecus</i> and <i>Homo habilis</i> S Africa E Africa) Oldowan culture—first stage of Palaeolithic or Old Stone Age (hunting and food gathering) which persisted until end of Ice Age c 8 000 B C
400 000	<i>Homo erectus</i> stage (Java China Africa) with crude chopping tools and early hand axes Heidelberg jaw Vertezüllos remains (Europe)
180 000	Ancestors of Neanderthals and <i>Homo sapiens</i> with advanced hand axes (Europe Steinheim and Swanscombe)
70 000	Neanderthals (Europe Asia N Africa) Rhodesian Man (S Africa) Solo Man (Java) Flake tools
40 000	First cold phase ends Neanderthal race becoming extinct
30 000	Second cold phase <i>Homo sapiens</i> (modern man) Implements show significant advances small knife-blades engraving tools Paintings and sculpture magic rites and ceremonies Cro-Magnons with Aurignacian culture
18 000	Final culmination of last ice age Aurignacian culture dying out to be replaced by Solutrean and then by the Magdalenian cultures Great flowering of Palaeolithic art
15 000	First immigrants from Asia to cross Behring Straits?
8 000	Last glaciers in Britain disappeared Proto Neolithic in Middle East Agricultural settlements (e.g. Jericho) Settled way of life leading eventually to such skills as weaving metallurgy inventions as ox-drawn plough wheeled cart
5 000	Britain becomes an island (land connection with continent severed by melting ice-sheets)

B C CIVILISATION IN THE MIDDLE EAST

4000	Susa founded
3500	Sumerian civilisation flourishes Cuneiform writing
3000	First Egyptian Dynasty Hieratic writing already perfected
	Early Minoan Age (Crete) Pictorial writing copper silver gold in use Early Mycenaean civilisation begins
2880	Memphis capital of Egypt

B C

2870	First settlements at Troy
2850	Golden Age of China begins (legendary)
2700	Great Pyramid age in Egypt begins
2400	Aryan migrations Sargon founds Akkade Semitic empire
2205	Hsia Dynasty begins in China (legendary)
2200	Middle Minoan Age pottery linear writing in pen and ink
1900	Bronze Age begins in Britain. Stonehenge (1860-1650 B C)
1780	Shang Dynasty begins in China (dated traditionally 1780-1122 B C)
1750	Aryan invasion of Mesopotamia
1720	Hyksos conquest of Egypt War chariots introduced
1700	Code of Hammurabi at Babylon
1600	Late Minoan Age bronze in use
1550	Sack of Babylon by Hittites
1548	18th Dynasty in Egypt commences Civilisation at peak (under Thotmes III 1490) Chronology more certain
1500	Powerful Mitanni (Aryan) kingdom in Asia Minor Phoenicia thriving—trade with Egypt and Babylonia Vedic literature in India
1450	Zenith of Minoan civilisation
1400	Ugarit (N Syria) culture at its zenith Cretan civilisation ends Knossos burnt Temple at Luxor built
1377	Amenhotep IV (Ikhnaton) the heretic Pharaoh
1350	Zenith of Hittite civilisation
1300	Israelite oppression (Rameses II) Phoenician settlements—Hellas and Spain (Cadix) Tyre flourishing
1250	Assyrian conquest in Babylon dominant in Western Asia

After years of effort he won the battle of Ethandun (Edington) and subsequently probably in 886 made peace with Guthrum leaving to the Danes the north and east. He built ships was an able administrator and promoted education his own translations from the Latin being part of the earliest English literature

Al Kwarizmi (fl c 830) Persian mathematician said to have given algebra its name

Allenby 1st Viscount (Edmund Henry Hynman Allenby) (1861-1936) British general. He served on the Western front 1914-16 commanded in Palestine 1917-18 capturing Jerusalem on 9 December 1917

Alleyne Edward (1566-1626) actor and founder of Dulwich College

Al Mamun (813-33) caliph of Baghdad son of Harun al Rashid. He built an observatory at Baghdad where observations were long recorded

Ampère André Marie (1775-1836) French physicist who propounded the theory that magnetism is the result of molecular electric currents. The unit of electric current is named after him

Amundsen Roald (1872-1928) Norwegian explorer the first to navigate the north west passage and to reach the south pole. Sailing in the fishing smack *Gjøa* he made the north west passage in 3 years 1903-6 and in 1911 sailed to the antarctic in the *Fram* reaching the pole on 14 December 1911 a month before his English rival Scott. His attempt to rescue Noble after his crash in the airship *Italia* cost him his life

Anacreon (c 630-475 B.C.) Greek lyric poet

Anaxagoras (488-428 B.C.) Ionian philosopher who

(180th Ed.)

came to Athens 464 B.C. and inspired Pericles and the poet Euripides with his love of science. His rational theories outraged religious opinion and like Socrates (who differed from him) he was indicted for impiety

Anaximander (611-547 B.C.) Milesian philosopher pupil of Thales the first among the Greeks to make geographical maps and to speculate on the origin of the heavenly bodies. He introduced the sun dial from Babylon or Egypt

Anaximenes (b c 570 B.C.) the last of the Milesian school founded by Thales. For him the primal substance was air and he was the first to see the differences between substances in quantitative terms

Andersen Hans Christian (1805-75) Danish writer especially of fairy tales such as *The Little Mermaid* and *The Ugly Duckling* which are still widely read. He also wrote an autobiography *Min Livs Jænter*

Anderson Elizabeth Garrett (1836-1917) one of the first English women to enter the medical profession. She practised in London for many years and later became mayor of Aldeburgh her native town the first woman to hold the office of mayor

Andrea del Sarto (1487-1531) Italian painter b Florence the son of a tailor. Known as the faultless painter he painted religious frescoes and other works his sculptor being in the National Gallery

Andree Salomon August (1854-07) Swedish explorer who attempted in 1897 to reach the north pole by balloon. In 1930 a Norwegian scientific expedition discovered the remains of the Andree expedition on White Island including a log book, sketch maps and diaries

Andrew St one of the apostles of Jesus brother of Simon Peter whose festival is observed on 30 November. He became the patron saint of Scotland in the 8th cent

Angelico Fra (1387-1455) Italian painter. An exquisite colourist. Via Giovanni (his Dominican name) painted especially religious frescoes mainly at Florence and Rome

Angell Sir Norman (1872-1967) political commentator author of *The Great Illusion* (1910) in which he argued that war could no longer pay and *The Money Game* (1918) Nobel peace prize 1933

Angstrom Anders Jons (1814-74) Swedish physicist who studied heat, magnetism and spectroscopy hence the angstrom unit used for measuring the wavelength of light

Anne Queen (1605-1714) Queen of Great Britain and Ireland. A daughter of James II she succeeded William III in 1702. The act of union with Scotland was passed in 1707. A well intentioned woman without marked ability she was influenced by favourites at first by the Duchess of Marlborough but in the main she was guided by Tory and high church principles (she established Queen Anne's Bounty to improve church finances). Her reign was notable for literary output (Swift Pope Addison Steele Defoe) developments in science (Newton) architecture (Wren Vanbrugh) and for the Duke of Marlborough's victories in war

Anouilh Jean (b 1910) French playwright See Section I

Anselm St (1093-1109) Italian scholar who succeeded Lanfranc as archbishop of Canterbury. He retrained William II but was able to work with the latter's successor Henry I

Anson 1st Baron (George Anson) (1697-1762) English admiral who sailed round the world 1740-44 his squadron being reduced during the voyage from seven ships to one. An account was compiled by his chaplain

Antoninus Pius (86-161) Roman emperor successor of Hadrian. In his reign which was peaceful the Antonine wall between the North and the Clyde was built to protect Britain from northern attack

Antonius Marcus (Mark Antony) (c 83-30 B.C.) Roman triumvir. He supported Caesar and after the latter's death was opposed by Brutus and Cassius and defeated by Octavian, committed suicide. His association with the Egyptian queen Cleopatra is the subject of Shakespeare's play

Anthony St (c 251-356) early promoter of the monastic life. B in Upper Egypt he retired into

- the desert where he was tempted but attracted disciples and founded a monastery. Took part in the Council of Nicaea 325. (From his supposed help against erysipelas derives its name of St. Antony's fire.)
- Apelles** 4th cent. B.C. Greek painter whose chief paintings which have not survived were of Alexander the Great holding a thunderbolt and of Aphrodite rising from the sea.
- Apollinaire Guillaume** (Wilhelm Apollinaris Kostrowitz) (1880-1918) French poet representative of the restless and experimental period in the arts before the first world war. He invented the term *surrealism*. B. Rome of Polish extraction.
- Apollonius of Perga** (fl. 220 B.C.) Greek mathematician of the Alexandrian school remembered for his conic sections introduced the terms *ellipse*, *parabola* and *hyperbola*.
- Apollonius Rhodius** (fl. 250 B.C.) scholar and poet of Alexandria and Rhodes librarian at Alexandria. His epic *Argonautica* is about the Argonaut heroes.
- Appert Nicholas** (1752-1841) sometimes known as François Appert invented the method of preserving animal and vegetable foods by means of hermetically sealed cans or tins and paved the way for the creation of a vast world industry.
- Appleton Sir Edward Victor** (1892-1965) English physicist best known as the discoverer of the ionised region of the upper atmosphere which became known as the Appleton layer. His researches led to the development of radar. Nobel prizewinner 1947.
- Aquinas Thomas, St** (c. 1225-74) scholastic philosopher and Dominican friar of Italian birth whose philosophico-theological system (called *Thomism*) is still accepted by Catholic ecclesiastics. He understood Aristotle well and interpreted his thought in accord with Christian teaching. His most important works are *Summa contra Gentiles* and *Summa theologiae*. See also *God and Man*, Section J.
- Arago Dominique François Jean** (1786-1853) French astronomer and physicist remembered for his discoveries in electromagnetism and optics.
- Archimedes** (287-212 B.C.) Greek mathematician b. Syracuse son of an astronomer remembered for his contributions to pure mathematics, mechanics and hydrostatics notably the Archimedeon screw for raising water, the conception of specific gravity, the doctrine of levers and the measurement of curved areas. Not less than his scientific knowledge was his practical skill. He was killed by the Romans in the siege of Syracuse.
- Argand, Aimé** (1755-1803) Swiss physician inventor of the lamp bearing his name which was the first to admit a current of air to increase the power of the flame by use of a chimney glass and circular wick.
- Arnosto Ludovico** (1474-1538) Italian poet author of *Orlando Furioso*.
- Arnsides (d. c. 468 B.C.)** Athenian general and statesman, called the just fought at Marathon.
- Arnsippus (c. 436-356 B.C.)** founder of the Cyrenaic school of philosophy. He taught that man should aim at pleasure but held that the pleasant was identical with the good.
- Aristophanes (c. 444-c. 385 B.C.)** Greek dramatist and comic poet who satirised Athenian life. Among his plays are *The Clouds* and *The Birds*.
- Aristotle (384-322 B.C.)** Greek philosopher pupil of Plato after whose death in 347 he left Athens to become tutor to the young prince Alexander of Macedonia. Subsequently at Athens he established his famous school in the garden known as the *Lyceum* where he lectured in the *peripatetic* (cloister) which gave his school of philosophy its name *Peripatetic*. He took the whole field of knowledge as his subject giving it unity and providing a philosophy which held its own for 2,000 years.
- Arkwright, Sir Richard** (1732-92) English inventor. A native of Preston and originally a barber he experimented with cotton spinning machines. His water frame (run by water power) patented in 1769 was an early step in the industrial revolution. In 1790 he made use of Boulton and Watt's steam engine. Rioters sacked one of his mills in 1779.
- Arne Thomas Augustine** (1710-78) English composer remembered for *Ride Britannia!* (from a masque called *Alfred*) and for Shakespearean songs such as *Where the bee sucks*. He also wrote operas (women singers appeared in *Judith* in 1761) and oratorios.
- Arnold Matthew** (1822-88) English poet, critic and educational reformer, son of Thomas. Among his poems is *The Scholar Gipsy*.
- Arnold Thomas** (1795-1842) English headmaster whose influence at Rugby gave it a high position among public schools.
- Arrhenius Svante August** (1859-1927) Swedish chemist, one of the founders of modern physical chemistry. Received 1903 Nobel prize for originating the theory of electrolytic dissociation (ionisation).
- Artaxerxes** the name borne by several ancient Persian kings. The first Artaxerxes son of Xerxes reigned 464-424 B.C. he was succeeded by Darius II 424-404 B.C. who was followed by Artaxerxes II who reigned until 358 B.C. Artaxerxes III the last to bear the name was a cruel and treacherous man and was poisoned in 338 B.C.
- Arthur (c. 600)** fabled Celtic warrior first referred to in the 9th cent. chronicle of Nennius who speaks of his 12 victories over the invading Saxons. In medieval times his legend developed an extensive literature woven together by Sir Thomas Malory in his *Morte d'Arthur* printed in 1485. Excavations are currently proceeding at South Cadbury Somerset the supposed site of his seat Camelot.
- Arundel Thomas** (1353-1414) archbishop of Canterbury 1396 and for a time lord chancellor. An enemy of heresy he persecuted the Lollards.

Columbanus St (c 540-615) Irish abbot who founded a number of monasteries in continental Europe. See Monasticism Section J

Columbus Christopher (c 1446-1506) Italian navigator who prevailing upon Ferdinand and Isabella of Spain to bear the expense of an expedition in 1492 discovered the Bahamas Cuba and other West Indian islands. In 1493 he landed on the lowlands of S. America

Comenius John Amos (1592-1670) Czech educationist and pastor advocate of the direct method of teaching languages of the use of pictures in education and of equality of educational opportunity for girls

Compton Arthur Holly (1892-1962) American physicist whose work on X rays established what is known as the Compton effect (1923). While professor of physics at the university of Chicago (1923-45) he helped to develop the atomic bomb. Nobel prizewinner 1927

Compton Karl Taylor (1897-1964) scientist administrator brother of the above. Pres. Massachusetts Institute of Technology 1930-48

Compton Burnett Ivy (1884-1969) English novelist whose books deal with family relationships and include *Postors and Masters* *Men and Wives* *A House and Its Head* *Manservant and Mandservant*. See Section M Part I

Comte August (1798-1857) French philosopher founder of positivism. See Positivism Section J

Condé Louis Prince de (1621-86) French general who defeated Spain at Rocroi in 1643

Confucius or K'ung Fu tse (c 551-478 B.C.) Chinese philosopher founder of the system of cosmology politics and ethics known as Confucianism. He was not concerned with the supernatural but appealed to reason and taught love and respect of one's fellows superiority to ambition charity forgiveness and repentance. See Confucianism Section J

Congreve William (1670-1720) Restoration dramatist whose witty plays include *The Way of the World* and *Love for Love*

Conrad Joseph (1857-1924) English novelist of Polish birth whose parents were exiled to France for political reasons. He became master mariner in the British merchant service and began to write novels after he left the sea in 1884. His novels include *Almayer's Folly* *Lord Jim* *No-Name*. See Section M Part I

Conscience Hendrik Henri (1812-83) Flemish novelist who wrote *The Lion of Flanders*

Constable John (1776-1837) English landscape painter b East Bergholt Suffolk. Unlike his contemporary Turner who journeyed over the continent with his sketchbook he found his scenes within a few miles of his home. His work was more popular in France than in England at the time and affected the Barbizon school and Delacroix. Examples of his work are in the National Gallery (including *The Hay Wain* *Flatford Mill* and *The Cornfield*) the Victoria and Albert and the Tate (*The Valley Farm*)

Constant Jean Joseph Benjamine (1845-1902) French painter of portraits and Oriental subjects

Constantine (274-338) called the Great the first Christian Roman emperor. He was proclaimed at York by the army in 306. He stabilised the empire after a period of decline and founded a new capital at Constantinople. A Christian council was held under his auspices at Nicaea in 325 and he was baptised on his death bed

Constantine I (1868-1923) King of Greece 1913-17 and 1920. He married Princess Sophia of Prussia sister of the Kaiser

Cook James (1723-79) English navigator son of an agricultural labourer. He entered the Royal Navy and gained a high reputation for his scientific skill. He made voyages of discovery to New Zealand and Australia in the ships under his command *Endeavour* *Resolution* and *Adventure*. He anchored at Botany Bay

in 1770 on his first voyage and gave it that name because of the interesting plants found on its shores. He also surveyed the Newfoundland coast. In an attempt to find the north west passage he was murdered at Hawaii.

Cooper Sir Astley Paston (1768-1841) English surgeon and author of medical textbooks.

Cooper James Fenimore (1789-1851) American novelist who produced stirring stories of adventure among them *The Spy*, *The Last of the Mohicans*, *The Pathfinder* and *The Deer Slayer*.

Cooper Samuel (1609-72) English miniaturist represented with his brother Alexander (d. 1660) in the Victoria and Albert Museum. Among his miniatures is a portrait of Cromwell.

Copernicus Nicolas (1473-1543) founder of modern astronomy b at Torun in Poland. He studied at Cracow and at a number of Italian universities before settling at Frauenburg in 1512 where he became canon of the cathedral. More of a student than a practical astronomer he spent most of his private life seeking a new theory of the heavenly bodies. In his *On the Revolution of the Celestial Orbs* published after his death he broke with the past and put forward the novel theory that the planets including the earth revolve round the sun.

Coppee François Joachim (1842-1908) French poet, novelist and dramatist.

Coquelin Benoît Constant (1841-1909) and Coquelin Ernest (1848-1909) (Coquelin aîné et cadet) brothers were leading lights of the French theatre.

Corelli Arcangelo (1653-1713) Italian composer and violinist who established the form of the concerto grosso. See Section I.

Cornaille Pierre (1606-84) French dramatist who ranks with Racine as a master of classical tragedy. *Le Cid*, *Polyeucte* and *Le Menteur* marked a new era in French dramatic production.

Cornwallis 1st Marquess (Charles Cornwallis) (1738-1805) British general who commanded the British forces which surrendered to the Americans at Yorktown in 1781 thus ending the war of independence. He was twice governor general of India.

Corot Jean Baptiste (1796-1875) French landscape painter.

Correggio Antonio Allegri da (1494-1534) Italian painter b Correggio. His style anticipates the baroque. His *Ecce Homo* is in the National Gallery.

Cortés Hernando (1488-1547) Spanish adventurer b Medellin Extremadura who captured Mexico for Spain crushing in ancient civilisation.

Coulton George Gordon (1868-1947) scholar and historian of the Middle Ages. In his *Fine Centuries of Religion* he sets forth his interpretation of monastic history in England from the Conquest to the Reformation.

Couperin a family of French musicians who were organists at St Gervais Paris from about 1650 till 1826. François Couperin (1668-1733) called Couperin the Great is the best known today for his harpsichord music.

Cousin Victor (1792-1867) French educationist and philosopher founder of the eclectic school.

Cousins Samuel (1801-87) English mezzotint engraver of plates after Reynolds Millais Landseer and Hogarth.

Cousteau Jacques Yves (b 1910) French underwater explorer pioneer of aqualung diving.

Couve de Murville Maurice (b 1900) French diplomat. General de Gaulle's foreign minister 1955-68.

Coverdale Miles (1488-1568) one of the early English reformers b Yorkshire later to become bishop of Exeter. He assisted Tyndale in translating the Pentateuch and completed his own translation of the Bible in 1535. The Psalms still used in the Prayer Book and many of the phrases in the authorised version of 1611 are from his translation.

Cowper William (1731-1800) English religious poet. His work is characterised by simplicity and tenderness. His best known poems are *John Gilpin* and *The Task*.

Cox David (1738-1859) English landscape painter. A collection of his works is in the Birmingham Gallery and the Tate Gallery.

Crabbe George (1754-1832) English narrative poet of grim humour author of *The Village* and *The Borough*.

Craig Edward Gordon (1872-1966) son of Ellen Terry producer and author of books on stagecraft.

Cramer Thomas (1489-1556) archbishop of Canterbury under Henry VIII and Edward VI an ardent promoter of the Reformation. On Mary's accession he at first consented to return to the old faith but when called upon to make public avowal of his recantation refused and was burnt at the stake. His contributions were the English Bible and Book of Common Prayer.

Crichton James (1500-82) Scottish adventurer who for his scholarly accomplishments was called the admirable Crichton. He was killed in a brawl.

Cripps Sir Stafford (1889-1952) British Labour statesman. A successful barrister he relinquished practice for public work. As chancellor of the exchequer in post war Britain his programme was one of austerity but his able position and single minded purpose won him general support. His health terminated his career.

Crispi Francesco (1810-1901) Italian statesman who aided Garibaldi and was later premier.

Crispin St (c 285) martyr with his brother. By tradition they were Roman and became shoe makers hence patron saints of shoemaking.

Croce Benedetto (1886-1952) Italian philosopher and critic. His philosophy is expounded in the four volumes of *Filosofia dello Spirito* (which has been translated into English). He founded and edited *La Critica* in 1903 a review of literature history and philosophy. He was strongly opposed to fascism.

Croesus (d c 546 b c) last king of Lydia reputed to be of immense wealth. Conquered and condemned to death by Cyrus he was relieved when Cyrus heard him recall Solon's saying 'Call no man happy till he is dead'.

Crome John (1769-1821) English landscape painter b Norwich.

Cromer 1st Earl of (Evelyn Baring) (1841-1917) British diplomat who as British consul-general in Egypt from 1883 to 1907 did much to maintain order improve the finances and promote development. His *Modern Egypt* appeared in 1908.

Crompton Samuel (1758-1827) English inventor of the spinning mule (1779) which substituted machinery for hand work. He was b near Bolton a farmer's son and benefited little by his invention.

Cromwell Oliver (1599-1658) Protector of the commonwealth of England Scotland and Ireland. B at Huntingdon he represented Huntingdon in parliament. When civil war broke out he served under the Earl of Essex and then reorganised the parliamentary army winning victories at Marston Moor and Naseby. Tortuous negotiations with Charles I could not be brought to an end and he promoted the king's trial and execution in 1649. He defeated the Scots at Dunbar. When continued difficulties beset government he became Protector in 1653 but was soon obliged to govern by major generals. His handling of Ireland enhanced the difficulties of that country. An able general and a strong character he was personally tolerant (an Independent) sincere and devout but he found himself in the revolutionary's dilemma—that there is no easy exit from a revolutionary situation thus paradoxically he provoked English aversion to military rule.

Cromwell Richard (1628-1712) son of the above and his successor in the protectorate.

Cromwell Thomas (1485-1540) English statesman who succeeded Wolsey in the service of Henry VIII and carried out the dissolution of the monasteries but on his fall from favour he was executed.

Crookes Sir William (1832-1919) English physicist who discovered the element thallium (1861) and invented the Crookes tube (1874) which was used by J J Thomson and others in their researches into the conduction of electricity in gases. He was also an authority on sanitation.

Cruikshank George (1792-1878) caricaturist and book illustrator, whose work includes illustrations to *Grimm's Fairy Tales*, and *Oliver Twist*. Collections of his work are in the British Museum and the Victoria and Albert Museum.

Cummings, Bruce Frederick (1889-1917), English

zoologist and author of *Journal of a Disappointed Alan*

Cunard, Sir Samuel (1787-1865) founder of the Cunard line of steam ships. He was born in Nova Scotia of a Welsh family of Quakers.

Cunningham of Hyndhope 1st Viscount (Andrew Browne Cunningham) (1882-1963) British admiral in two world wars b Edinburgh. He served as commander in chief Mediterranean 1939-42 and Feb-Oct 1943 naval commander in chief for the Allied assault on North Africa 1942. first sea lord 1943-6.

Curie Marie Skłodowska (1867-1934) first great woman scientist b Poland. Her father was a professor of physics at Warsaw. She came to Paris to study at the Sorbonne and married Pierre Curie (1859-1906) professor of physics. Thus began a fruitful collaborative career that led to the discovery of radium for which they shared the 1903 Nobel prize for physics. In 1911 Mme Curie received the Nobel prize for chemistry. Pierre Curie was killed in an accident. See also Joliot Curie.

Curzon of Kedleston 1st Marquess (George Nathaniel Curzon) (1859-1925) statesman and administrator viceroy of India 1898-1905 member of Lloyd George's war cabinet 1916-18 foreign secretary 1919-24.

Cuthbert St (c 835-87) Celtic monk who became prior of Old Melrose (on the Tweed) and later of Lindisfarne. For a time he lived in seclusion on one of the Farne islands. The story of his life we owe to Bede.

Cuvier Georges (1769-1832) French naturalist, noted for his system of classification of animals and his studies in comparative anatomy. His *Le Règne Animal* (1819) was a standard work for many years.

Czyp Albert (1620-91) Dutch landscape painter of sea and river views.

Cyprian St (d 268) bishop of Carthage and early Christian writer who was martyred.

Cyrus (559-330 B.C.) Persian emperor. He founded the Achaemenid line having defeated the Medes. By conquering Lydia and Babylonia he controlled Asia Minor. He was a wise and tolerant ruler allowing the Jews to rebuild their temple.

D

Daguerre Louis Jacques Mandé (1789-1851) French photographic pioneer who invented the daguerrotype process. See L29.

Daimler Gottlieb (1834-90) German inventor with N. A. Otto of Cologne of the Otto gas engine. The Mercedes car exhibited at Paris in 1900 was named after his daughter.

Dale Sir Henry Hallett (1875-1968) English physiologist. He shared the 1936 Nobel prize for medicine for his work on the chemical transmission of nerve impulses.

Dalhousie 1st Marquess of (James Andrew Broun Ramsay) (1812-60) governor general of India. He annexed the Punjab and later other states, opened the civil service to Indians and acted against suttee.

Dalton John (1766-1841) English chemist and mathematician a Quaker teacher of Manchester. In 1808 in the first number of his *New System of Chemical Philosophy* (1808-27) the modern chemical atomic theory was first propounded by him. According to this the atoms of the chemical elements are qualitatively different from one another. See Section F Part II.

Danien, Father (1840-89) Belgian missionary priest originally named Joseph de Veuster who witnessing the sufferings of the lepers confined on the Hawaiian island of Molokai obtained permission to take charge and remained there until he himself died of leprosy.

Damocles 5th cent. B.C. Syracusan flatterer who pronounced the tyrant Dionysius the happiest of men. To illustrate the uncertainty of life Dionysius invited him to a banquet where a naked sword hung over his head by a hair. Hence the expression *Sword of Damocles* to mean impending danger or threat.

Damrosch, Walter Johannes (1862-1950) Ameri-

can conductor and composer b Breslau Prussia. He promoted musical development in the U.S. especially while conductor of the New York Symphony Society which his father Leopold Damrosch (1832-1885) had founded in 1878.

D'Annunzio Gabriele (1863-1938) Italian poet, dramatist and nationalist. In 1919 he led a raid on Fiume and seized it but was eventually forced to surrender. His bodyguard wore the black shirt which was to be the uniform of the Fascists.

Dante Alighieri (1265-1321) Italian poet a figure of world literature. He was b at Florence in a troubled period. Though he saw her but once or twice he loved a lady whom he called Beatrice who is believed to have been Bice Portinari who married Simone di Bardi. She died in 1290 after which Dante wrote his *Vita Nuova*. His next work *Convivio* was philosophical. He joined the party of the Bianchi attained municipal office but was imprisoned and in 1301 fled. His *Divina Commedia* is a description of hell, purgatory and heaven a work of moral edification replete with symbolism. He d at Ravenna.

Danton, Georges Jacques (1759-94) French revolutionary. To his eloquent lead in 1792 was largely due the defeat of the foreign forces attempting to quell the revolution. He was a member of the committee of public safety and sought to modify the extremists but was displaced by Robespierre and was subsequently executed.

D'Arblay See Burney.

Darius I (484-486 B.C.) Persian king and founder of the Peisepolis. He extended the borders of the Persian empire beyond the Indus and reorganized it into satrapies. He declared God's plan for the earth is not turmoil but peace, prosperity and good government. On clashing with the Greeks however he was defeated at Marathon. Darius II was the natural son of Artaxerxes I and d 405 B.C. Darius III (d 331 B.C.) was the last of the Persian kings and was defeated by Alexander and assassinated.

Darling Grace Horsley (1815-42) English heroine who by putting off in a small boat from the light house on one of the Farne islands of which her father was keeper saved the shipwrecked crew of the *Forfarshire*.

Darnley Henry Stewart Lord (1545-67) second husband of Mary Queen of Scots (1565). He plotted the murder of her secretary Rizzio and was subsequently himself murdered. Through his son James I he is the ancestor of the Stuart monarchs.

Darwin Charles Robert (1809-82) English naturalist b Shrewsbury one of the pioneers of experimental biology. After returning from his formative voyage round the world as naturalist on the *Beagle* (1831-6) he spent nearly twenty years building up evidence for his theory of evolution before publishing it in *The Origin of Species* (1859). In it he argued that the evolution of present day morphology had been built up by the gradual and opportunistic mechanism of natural selection. His ideas though welcomed by biologists aroused bitter controversy. See Section F Part IV.

Daudet Alphonse (1840-97) French writer who covered a wide range and whose works include *Lettres de mon Moulin*, *Robert Helmont* and *Tartarin de Tarascon*.

D'Avenant, Sir William (1606-68) English dramatist and author of the first attempt at English opera *Siege of Rhodes* (the music for which was composed by Charles Coleman and George Hudson).

David I (1084-1153) King of Scotland. As uncle of Matilda daughter of Henry I of England he supported her claim to the English crown but was defeated. In Scotland he promoted unity and development.

David II (1324-71) King of Scotland. He was son of Robert Bruce. In invading England he was captured at Neville's Cross 1346.

David Sir Edgeworth (1856-1934) Australian geologist who accompanied Shackleton's ant arctic expedition 1907-9 leading the party that reached the south magnetic pole.

David Jacques Louis (1748-1825) French painter of classical subjects and an ardent republican.

- David St. patron saint of Wales who lived in south Wales in the 6th cent.
- Davidson 1st Baron (Randall Thomas Davidson) (1848-1930) archbishop of Canterbury 1903-28
- Daves Sir Walford (1869-1941) English organist, composer and broadcaster on music
- Davies William Henry (1871-1940) Welsh poet. He spent some years tramping both in England and America and his work shows knowledge of and love for nature. He wrote *Autobiography of a Super tramp*
- Da Vinci See Leonardo
- Davis Jefferson (1808-89) American civil war leader. B in Kentucky he was made president of the Confederate States when the civil war broke out. After the war he was tried for treason but discharged. He wrote *The Rise and Fall of the Confederate Government*
- Davis John (c. 1560-1608) Elizabethan explorer and discoverer of Davis's Strait, the channel between the Atlantic and Arctic oceans on the west of Greenland. Invented the backstaff or Davis's quadrant
- Davitt Michael (1846-1906) Irish nationalist. The son of a peasant who later came to England, he joined the Fenians and in 1870 was sentenced to penal servitude. On his release he helped to found the Land League in 1879, was again imprisoned and wrote *Leaves from a Prison Diary*. He was subsequently returned to parliament
- Davy Sir Humphry (1778-1829) English chemist. b Penzance. Much of his work found practical application e.g. the miner's safety lamp which still bears his name. His *Elements of Agricultural Chemistry* (1813) contains the first use in English of the word 'element'. He took Michael Faraday as his assistant at the Royal Institution
- Dawber Sir Guy (1861-1938) English architect. As chairman of the Council for the Preservation of Rural England he did much to bring about the restoration of buildings throughout the country
- Day Lewis Cecil (b 1904) poet and critic. professor of poetry at Oxford 1951-6. He succeeded Massell as poet laureate in 1968. See Section M, Part II
- Debussy Claude Achille (1862-1918) composer and leader of the French Impressionist school in music. Among his works are *Suite bergamasque* containing the popular *Clair de lune*. *L'Après midi d'un Faune* inspired by the poem of Mallarmé and *La Mer*. He also wrote an opera *Pelléas et Mélisande* based on Maeterlinck's drama. See also Section E

- Mary II** (1662-94) Queen of England with her husband the Dutch William III. As daughter of James II she was invited to succeed after the revolution of 1688 and expelled her father.
- Mary Stuart** Queen of Scots (1542-87) daughter of James V of Scotland and Mary of Guise she laid claim to the English succession. She was imprisoned in England by Elizabeth and beheaded. Her husbands were the dauphin of France (d. 1560) Lord Darnley (murdered 1566) and Bothwell.
- Masaryk Jan Garrigue** (1886-1948) Czech diplomat. The son of Thomas he was Czech minister in London 1926-38 and foreign secretary while his government was in exile in London and after it returned to Prague 1940-8.
- Masaryk Thomas Garrigue** (1850-1937) Czech statesman and independence leader. He was the first president of Czechoslovakia 1918-35.
- Masogni Pietro** (1863-1945) Italian composer of *Cavalleria Rusticana*.
- Masefield John** (1875-1967) English poet. His best known works are *Salt Water Ballads* (as a boy he ran away to sea) and *Reynard the Fox*. He became poet laureate in 1939.
- Ma velvne John Nevill** (1839-1917) English illusionist. He also exposed spiritualistic frauds.
- Massenet Jules Emile Frédéric** (1842-1912) French composer of songs, orchestral suites, oratorios and operas among them *Manon* and *Thais*.
- Masine Léonide** (b. 1896) Russian dancer one of Diaghilev's choreographers. In 1944 he became a U.S. citizen.
- Masters Edgar Lee** (1869-1950) American poet remembered for his *Spoon River Anthology*.
- Matisse Henri** (1869-1954) French painter member of a group known as *Les Fauves* (the wild beasts) for their use of violent colour and colour variation to express form and relief. A number of his paintings are in the Moscow Museum of Western Art.
- Matsys (Massys) Quentin** (1466-1530) Flemish painter. In Louvain settled Antwerp he worked at a time when Italian influence was gaining ground. His *Money changer and his Wife* is in the Louvre.
- Maugham William Somerset** (1874-1965) British writer b. Paris. He practised as a doctor till the success of *Liza of Lambeth* (1897) followed by *Of Human Bondage*. He was a master of the short story and his work reflects his travels in the East. In both world wars he served as a British agent.
- Maupassant Guy de** (1850-93) French writer whose novels and short stories show penetrating realism. His stories include *Boule de Suif*, *La Maison Tellier* and *La Peau*.
- Mauriac François** (1885-1970) French writer whose novels deal with moral problems and include *Le Baiser au Lépreux* and the play *Asmodée*. Nobel prizewinner 1952.
- Mauvols André (Emile Herzog)** (1885-1967) French writer whose works include lives of Shelley and Disraeli.
- Maxim, Sir Hiram Stevens** (1840-1916) American inventor of the automatic quick firing gun perfected in London.
- Maxton James** (1885-1946) Scottish Labour politician and pacifist entered parliament 1922 chairman of I.L.P. 1928-31 1934-9.
- Maxwell James Clerk** (1831-79) Scottish physicist. He wrote his first scientific paper at 15 and after teaching in Aberdeen and London became first Cavendish professor of experimental physics at Cambridge. His mathematical mind working on the discoveries of Faraday and others gave physics a celebrated set of equations for the basic laws of electricity and magnetism. His work revolutionised fundamental physics. *See Section F Part II*
- Mazarin Jules** (1602-61) cardinal and minister of France was b. in Italy. In spite of opposition from the nobles, he continued Richelieu's work of building up a strong centralised monarchy.
- Mazeppa Ivan Stepanovich** (1644-1709) Cossack nobleman b. Ukraine (then part of Poland before it became part of Russia 1667). He fought unsuccessfully for independence allying himself with Charles XII of Sweden against Peter I of Russia (Poltava 1709). According to legend he was punished for intrigue by being tied to the back of a wild horse and sent into the steppes. Byron wrote a poem about him.
- Mazzini Giuseppe** (1805-72) Italian patriot. In Genoa he advocated a free and united Italy and from Marseille he published a journal *Young Italy* expelled from the continent he took refuge in London in 1837. In 1848 he returned to Italy and became dictator of the short lived Roman republic which was put down by French forces. His contribution to Italian unity was that of preparing the way.
- Medawar Sir Peter Brian** (b. 1915) British zoologist author of *The Art of the Soluble* and *The Future of Man*, president of the British Association 1969. Nobel prizewinner 1960.
- Medici Florentine family** of merchants and bankers who were politically powerful and who patronised the arts. Cosimo the Elder (1389-1464) was for over 20 years virtual ruler of Florence. His grandson Lorenzo the Magnificent (1449-92) poet friend of artists and scholars governed with munificence. His grandson Lorenzo was father of Catherine de' Medici Queen of France (q.v.). After Cosimo (1516-74) was an able Duke of Florence and then Grand Duke of Tuscany which title the Medici held until 1737.
- Méhul Etienne Nicolas** (1783-1817) French operatic composer. *Joseph* is his masterpiece.
- Meitner, Lise** (1878-1969) co worker of Otto Hahn (q.v.) who interpreted his results (1939) as a fission process. A Jewish refugee scientist from Germany she became a Swedish citizen in 1949.
- Melancthon Philip** (1497-1560) German religious reformer who assisted Luther and wrote the first Protestant theological work *Loci communes*. He drew up the Augsburg confession (1530).
- Melba Nellie** (Elen Porter Mitchell) (1861-1931) Australian soprano of international repute b. near Melbourne.
- Melbourne End Viscount (William Lamb)** (1770-1843) English Whig statesman was premier at the accession of Queen Victoria.
- Mendel Gregor Johann** (1822-84) Austrian botanist. After entering the Augustinian monastery at Brunn he became abbot and taught natural history in the school. His main interest was the study of inheritance and his elaborate observations of the common garden pea resulted in the law of heredity which bears his name. His hypothesis was published in 1866 but no attention was given to it until 1900. *See Section F Part IV*.
- Mendeleev Dmitri Ivanovich** (1834-1907) Russian chemist first to discover the critical temperatures. He formulated the periodic law of atomic weights (1869) and drew up the periodic table predicting the properties of elements which might fill the gaps. Element 101 is named after him.
- Mendelssohn Bartholdy Felix** (1809-47) German composer grandson of Moses Mendelssohn philosopher. He belongs with Chopin and Schumann to the early 19th cent. classic romantic school and his music has delicacy and melodic beauty. He was conductor of the Gewandhaus concerts at Leipzig for a time and often visited England. *See Section E*.
- Mendès France, Pierre** (b. 1907) French politician premier 1954-5 but defied on his North African policy. He was a critic of de Gaulle.
- Menuhin, Yehudi** (b. 1916) American violinist b. New York of Jewish parentage. He first appeared as soloist at the age of seven and has international repute.
- Menzies Sir Robert Gordon** (b. 1894) Australian Liberal statesman, premier 1939-41 1949-66.
- Mercator Gerhardus** (Gerhard Kremer) (1612-94) Flemish geographer who pioneered the making

of accurate navigational maps. He worked out the map which bears his name in which meridians and parallels of latitude cross each other at right angles enabling compass bearings to be drawn as straight lines.

Meredith George (1825-1909) English writer b. Portsmouth. His novels include *The Ordeal of Richard Feverel*, *The Egoist*, *Evans Harrington*, *Diana of the Crossways* and *The Amazing Marriage*. His poetry has had renewed attention in the main works are *Modern Love* and *Poems and Lyrics of the Joy of Earth*.

Mesmer Friedrich Anton (1734-1815) Austrian founder of mesnialism or animal magnetism. See Mesmerism, Section J.

Mestrovic Ivan (1889-1962) Yugoslav sculptor of international reputation. He designed the temple at Kosovo. He later lived in England and examples of his work are in London museums.

Metastasio Pietro (Pietro Bonaventura Trapassi) (1698-1782) Italian librettist who lived in Vienna and provided texts for Gluck, Handel, Haydn and Mozart.

Mechnikov Ilya (1845-1916) Russian biologist who discovered that by phagocytosis certain white blood cells are capable of ingesting harmful substances such as bacteria (see Diseases of the Blood, Section P). For his work on immunity he shared the 1908 Nobel prize for medicine.

Michelangelo (Michelagnolo Buonarroti) (1475-1564) Italian painter, sculptor and poet. Of a poor but genteel Tuscan family, his first interest in sculpture came through his nurse wife of a stone cutter. He was apprenticed to Domenico Ghirlandajo. Like Leonardo, he studied anatomy but instead of spreading his talents over a wide field, he became obsessed with the problem of how to represent the human body. In him classical idealism, mediaeval religious belief and renaissance energy met. Perhaps his most impressive work is the ceiling of the Sistine Chapel (a surface of about 8,000 square feet). The *Last Judgement* behind the chapel altar, his marble *Pieta* (St. Peter's) the statue of *David* (Academy, Florence), the great figure of *Moses* (San Pietro in Vincoli, Rome) and the four allegorical figures *Day*, *Night*, *Dawn*, *Twilight* (intended for the tombs of the Medici family at San Lorenzo, Florence).

Michelet Jules (1798-1874) French historian who wrote a history of France in 24 vols. and of the revolution in 7 vols.

Michelson Albert Abraham (1852-1931) American physicist b. Poland. He collaborated with D. W. Morley in an experiment to determine whether drift, the negative result of which was important for Einstein. Nobel prizewinner 1907. See Relativity, Section F, Part II.

Mickiewicz Adam (1798-1855) Polish revolutionary poet, author of *The Ancestors* and *Pan Tadeusz*.

Mill John Stuart (1806-73) English philosopher. A member of Bentham's utilitarian school, he later modified some of its tenets. His main work is *On Liberty*, which advocates social as well as political freedom and warns against the tyranny of the majority. *The Subjection of Women* supported women's rights. From 1935 an aggressive foreign policy (Abyssinia and Spain) was at first successful and in June 1940 he entered the war on the side of Hitler. Defeat in North Africa and the invasion of Sicily caused the collapse of his government. He was shot dead by partisans while attempting to escape to Switzerland.

Mussorgsky Modest Petrovich (1839-81) Russian composer whose masterpiece is the opera *Boris Godunov* after the play by Pushkin. His piano suite *Pictures at an Exhibition* was orchestrated by Ravel. See Section E.

N

Nanak (1469-1538) Indian guru or teacher who tried to put an end to religious strife teaching that God is one whether he be Allah or Rama. His followers are the Sikhs. See Sikhism Section J.

Nansen Fridtjof (1861-1930) Norwegian explorer. In 1893 his north polar expedition reached the highest latitude till then attained—86° 14'. He published an account called *Farthest North*. He was active in Russian famine relief 1921. Nobel peace prize 1922.

Napier John (1550-1617) Scottish mathematician b. Edinburgh invented logarithms (published 1614) and the modern notation of fractions improvements in the methods of mathematical expression which helped to advance cosmology and physics.

Napoleon I (Bonaparte) (1769-1821) French emperor and general of Corsican birth (Ajaccio). Trained in French military schools he became prominent in the early years of the revolution with uncertainty at home and war abroad. In 1796 he became commander of the army in Italy and defeated the Austrians so that France obtained control of Lombardy. He then led an expedition to Egypt but Nelson destroyed his fleet. After further Italian victories he made a *coup d'état* in 1799 and in 1804 became emperor. Against continuing European opposition he defeated the Austrians at Austerlitz and his power in Europe was such that he made his brothers Joseph Louis and Jerome kings of Naples Holland and Westphalia, but in Spain he provoked the Peninsular War and his armies were gradually driven back by the Spanish helped by Wellington while his invasion of Russia in 1812 ended in a disastrous retreat from Moscow and in 1814 the Allies forced him to abdicate and retire to Elba. He emerged again in 1815 to be defeated at Waterloo and exiled to St. Helena. His government at home was firm and promoted some reforms (e.g. legal codification) but the country was weakened by his wars. In Europe in spite of the suffering caused by war there was some spread of French revolutionary ideas and equally a reaction against them on the part of authority. The Imperial idea lingered in France and Napoleon's remains were brought to Paris in 1840. He married first Josephine Beauharnais and second Marie Louise of Austria.

Napoleon II (1811-32) son of Napoleon I and Marie Louise.

Napoleon III (1808-79) son of Napoleon I's brother Louis. He returned to France in the revolution of 1848 and in 1851 came to power by a *coup d'état*. In his reign Paris was remodelled. His foreign policy was adventurous (the Crimean war intervention in Mexico war against Austria and Italy) but when he was manoeuvred by Bismarck into the Franco-Prussian war and defeated at Sedan he lost his throne and retired to England. His wife was the Spanish Eugénie de Montijo.

Nash, John (1752-1835) English architect who planned Regent Street laid out Regent's Park enlarged Buckingham Palace, and designed Marble Arch and the Brighton Pavilion.

Nash Paul (1889-1946) English painter and designer official war artist in both world wars. Best known pictures are *The Menin Road* of 1918 and *Totes Meer* of 1941.

Nash Walter (1882-1968) New Zealand Labour politician prime minister 1957-60.

Nasmyth James (1808-90) Scottish inventor of the steam hammer which became indispensable in all large iron and engineering works.

Nasser Gamal Abdel (1918-70) leader of modern Egypt and of the Arab world. He led the 1952 army coup that deposed King Farouk becoming president of the first Egyptian Republic in 1956 and of the United Arab Republic in 1958. His nationalisation of the Suez Canal in 1956 precipitated a short lived attack by Britain and France. Israeli Arab hostility led to the June war of 1967. He carried out reforms to bring his people out of feudal backwardness including the building (with Russian help and finance) of the Aswan High Dam.

Needham Joseph (b. 1900) British biochemist historian of science orientalist author of the historical work *Science and Civilisation in China* (7 vols. 1954-).

Neiru Pandit Jawaharlal (1889-1964) Indian national leader and statesman first prime minister and minister of foreign affairs when India became independent in 1947. He studied at Harrow and Cambridge and was for many years a leading member of the Congress Party during which time he was frequently imprisoned for political activity. He played a part in the final negotiations for independence. Under his leadership India made technical industrial and social advances. In world affairs his influence was for peace and non alignment.

Nelson 1st Viscount (Horatio Nelson) (1758-1805) English admiral. Son of a Norfolk clergyman he went to sea at 12 and became a captain in 1793. In the French revolutionary wars he lost his right eye in 1794 and his right arm in 1797. Rear admiral in 1797 he defeated the French at Aboukir Bay in 1798. He was also at the bombardment of Copenhagen in 1801. In 1805 he destroyed the French fleet at Trafalgar in which battle he was killed. His daring and decision made him a notable commander. Nenni Pietro (b. 1891) Italian socialist politician. He became secretary general of his party in 1944 and was deputy prime minister 1963-8.

Nernst, Walther Heilmann (1864-1941) German scientist who established the third law of thermodynamics that dealt with the behaviour of matter at temperatures approaching absolute zero. Nobel prizewinner 1920.

Nero Claudius Caesar (A.D. 37-68) Roman emperor the adopted son of Claudius. He was weak and licentious and persecuted Christians. In his reign occurred the fire of Rome.

Newcomen Thomas (1663-1729) English inventor one of the first to put a steam engine into practical operation. In 1705 he patented his invention which was the pumping engine used in Cornish mines until the adoption of Watt's engine.

Newman Ernest (1868-1959) English music critic whose chief work is the *Life of Richard Wagner*. He also wrote *A Musical Critic's Holiday*.

Newman John Henry (1801-90) English priest and writer who became a cardinal of the Roman church in 1879 and was a founder of the Oxford Movement. He is best remembered by his *Apologia pro Vita Sua* in which he described the development of his religious thought. He wrote *Lead kindly Light* set to music 30 years later by J. B. Dykes and *The Dream of Gerontius* set to music by Elgar. See Tractarianism Section J.

Newton Sir Isaac (1642-1727) English scientist b. Woolsthorpe (Lincolnshire) (the year Galileo died). He studied at Cambridge but was at home during the plague years 1665 and 1666 when he busied himself with problems concerned with optics and gravitation. Through his tutor Isaac Barrow he was appointed to the Lucasian chair of mathematics at Cambridge in 1669 and remained there until 1689 when he was appointed Warden and later Master of the Mint. He was a secret Unitarian and died not married. His three great discoveries were to show that white light could be separated into a sequence of coloured

components forming the visible spectrum to use the calculus (invented by him independently of Leibnitz) to investigate the forces of nature in a quantitative way and to show by his theory of gravitation (for which Copernicus, Kepler and Galileo had prepared the way) that the universe was regulated by simple mathematical laws. His vision was set forth in the *Philosophiæ Naturalis Principia Mathematica* of 1687 usually called the *Principia*. It was not until 200 years later that Einstein showed there could be another theory of celestial mechanics.

Ney Michel (1789-1815) French general who served under Napoleon especially at Jena, Borodino and Waterloo.

Nicholas II (1868-1918) last emperor and Tsar of Russia son of Alexander III. His reign was marked by an unsuccessful war with Japan (1904-5) and by the 1914-18 war. Ineffective and lacking ability he set up a Duma in 1906 too late for real reform. Revolution broke out in 1917 and he and his family were shot in July 1918.

Nicholas St (4th cent.) bishop of Myra is associated with Christmas under the corruption of Santa Claus.

Nicholson Sir William (1872-1949) English artist known for his portraits and woodcuts. His son **Ben Nicholson O.M.** (b 1894) is noted for his abstract paintings.

Nicolson Sir Harold (1886-1968) English diplomat, author and critic. His works include *King George V* and *Dunes and Letters*. His wife was the novelist Victoria Sackville-West (1892-1962).

Niemöller Martin (b 1892) German Lutheran pastor who opposed the Nazi regime and was confined in a concentration camp. He was president of the World Council of Churches in 1961.

Nietzsche Friedrich Wilhelm (1844-1900) German philosopher in his younger years influenced by Wagner and Schopenhauer. His teaching that only the strong ought to survive and his doctrine of the superman are expounded in *Thus Spoke Zarathustra*, *Beyond Good and Evil* and *The Will to Power*.

Nightingale Florence (1820-1910) English nurse and pioneer of hospital reform who during the Crimean war organised in face of considerable official opposition a nursing service to relieve the sufferings of the British soldiers who called her the lady with the lamp. Her system was adopted and developed in all parts of the world.

Nijinsky, Vaslav (1892-1950) Russian dancer, one of the company which included Pavlova, Karsavina and Fokine brought by Diaghilev to Paris and London before the 1914-18 war. In *Les Sylphides*, *Spectre de la Rose* and *L'Après midi d'un Faune* he won a supreme place among male dancers.

Nikisch Arthur (1855-1922) Hungarian conductor of the Boston Symphony Orchestra 1889-93. He was piano accompanist to the Lieder singer Elena Gerhardt.

Nimitz Chester William (1885-1966) American admiral commanded in the Pacific 1941-5, chief of naval operations 1945-7.

Nixon Richard Milhous (b 1913) Republican president of the U.S. 1969- elected to Congress 1946 to Senate 1951, vice president 1952, re-elected 1956, received Republican presidential nomination in 1960 when Kennedy won with a narrow majority.

Nkrumah Kwame (b 1899) Ghanaian leader, first premier of Ghana when his country achieved independence in 1957 and president in 1960. His government was spectacular and he promoted the Pan African movement but unsound finance and dictatorial methods led to his overthrow in 1966.

Nobel Alfred Bernhard (1833-96) Swedish inventor and philanthropist. An engineer and chemist who discovered dynamite he amassed a large fortune from the manufacture of explosives and bequeathed a fund for annual prizes to those who each year have contributed most to the benefit of mankind in the fields of physics, chemistry, physiology or medicine, literature and peace. See L186-8.

North, Frederick (1782-92) favourite minister of George III who held the premiership from 1770 to 1782. (He held the courtesy title of Lord

North from 1762.) His incompetent foreign policy led to the American war of independence.

Northcliffe 1st Viscount (Alfred Charles Harmsworth) (1865-1922) British journalist and newspaper proprietor b near Dublin. He began *Answers* in 1888 with his brother Harold (later Lord Rothermere). In 1894 they bought the *Evening News* and in 1896 the *Daily Mail*. In 1908 he took over *The Times*.

Northumberland John Dudley Duke of (1502-53) English politician who attempted to secure for his daughter in law Lady Jane Grey the succession to the throne after Edward VI.

Nostradamus or Michel de Notre Dame (1503-66) French astrologer and physician known for his prophecies in *Centuries*.

Novals the pseudonym of Baron Friedrich von Hardenberg (1772-1801) German romantic poet and novelist whose chief work is the unfinished *Heinrich von Ofterdingen*.

Nuffield 1st Viscount (William Richard Morris) (1877-1963) British motor car manufacturer and philanthropist and until he retired in 1952 chairman of Morris Motors Ltd. He provided large sums for the advancement of medicine in the university of Oxford for Nuffield College and in 1943 established the Nuffield Foundation endowing it with £10 million.

Nyerere Julius (b 1922) Tanzanian leader. He became first premier of Tanganyika when it became independent in 1961 and president in 1962. In 1964 he negotiated its union with Zanzibar.

O

Oates, Lawrence Edward (1880-1912) English antarctic explorer. He joined Scott's expedition of 1910 and was one of the five to reach the south pole but on the return journey being crippled by frost bite he walked out into the blizzard to die.

Oates Titus (1649-1705) English informer and agitator against Roman Catholics.

O'Casey Sean (1884-1964) Irish dramatist whose plays include *Junno* and *The Playboy*. *The Silver Tassie*, *Red Roses for Me* and *Oak Leaves and Lavender*.

Ockam (Ockham) William of (c 1270-1349) English scholar and philosopher and one of the most original thinkers of all time. He belonged to the Order of Franciscans, violently opposed the temporal power of the Pope, espoused the cause of nominalism and laid the foundations of modern theories of government and theological scepticism. See Ockham's razor Section J.

O'Connell Daniel (1775-1847) Irish national leader. A barrister he formed the Catholic Association in 1823 to fight elections. His followers aimed at the repeal of the Act of Union with England and formed a Repeal Association in 1840, but the formation of the Young Ireland party, the potato famine and ill health undermined his position and he died in exile.

O'Connor Feargus (1794-1855) working class leader in England of Irish birth. He presented the Chartist petition in 1848.

O'Connor Thomas Power (1848-1929) Irish nationalist and journalist, sat in parliament 1880-1929 and founded the *Star*.

Oersted, Hans Christian (1777-1851) Danish physicist who discovered the connection between electricity and magnetism.

Offa (d 796) king of Mercia (mid England) was the leading English king of his day and built a defensive dyke from the Dee to the Wye.

Offenbach Jacques (1819-80) German-Jewish composer b Cologne settled at Paris and is mainly known for his light operas especially *Tales of Hoffmann*.

Ohm, Georg Simon (1787-1854) German physicist professor at Munich who in 1826 formulated the law of electric current known as Ohm's law one of the foundation stones in electrical science. See L86.

Olivier, Baron (Laurence Kerr Olivier) (b 1907) British actor and director especially in Shakespearean roles. He has also produced, directed and played in films including *Henry V*, *Hamlet*

- and *Richard III*. In 1962 he was appointed director of the National Theatre and in 1970 received a life peerage.
- Oman, Sir Charles William** (1860-1946) English historian especially of mediæval warfare and of the Peninsular War. He also wrote memoirs.
- Omar ibn al Khattab** (581-644) adviser to Mahomet succeeded Abu Bakras 2nd caliph. In his reign Islam became an imperial power. He died at the hands of a foreign slave.
- Omar Khayyâm** (c 1050-1123) Persian poet and mathematician called Khayyâm (tent maker) because of his father's occupation. His fame as a scientist has been eclipsed by his *Rubaiyat* made known to English readers by Edward FitzGerald in 1859.
- O'Neill, Eugene Gladstone** (1888-1953) American playwright who after spending his adventurous youth in sailing gold prospecting and journalism first won success in 1914 with the one act play *Thurst*. His later plays include *Anna Christie* *Strange Interlude* *Mourning Becomes Electra* *The Iceman Cometh*. Nobel prizewinner 1936. See also Section I.
- Orchardson, Sir William Gulliver** (1835-1910) Scottish painter b Edinburgh best known for his *Napoleon I on board H.M.S. Bellerophon* and *Ophelia*.
- Origen** (c 185-254) Christian philosopher and Biblical scholar who taught at Alexandria and Caesarea and was imprisoned and tortured in the persecution of Decius 250. He drew on Greek philosophy as well as on the Hebrew scriptures in his exposition of Christian doctrine.

He was president of the Land League but was not implicated in crimes committed by some members. His party supported Gladstone who became converted to Home Rule. His citation in divorce proceedings brought his political career to an end.
- Parry, Sir William Edward** (1790-1855) English explorer and naval commander in the Arctic where he was sent to protect fisheries and also tried to reach the north pole.
- Parsons, Sir Charles Algernon** (1854-1931)

- English inventor of the steam turbine who built the first turbine-driven steamship in 1897
- Pascal Blaise** (1623-02) Frenchman of varied gifts b at Clermont Ferrand At first a mathematician he patented a calculating machine His *Lettres provinciales* influenced Voltaire In 1654 he turned to religion and his incomplete religious writings were published posthumously as *Pensées* See also Jansenism
- Pastermak, Boris Leonidovich** (1890-1960) Russian poet and writer B Moscow he published his first poems in 1931 For some years his time was spent in translating foreign literature but in 1958 his novel *Dr Zhivago* which describes the Russian revolution and is in the Russian narrative tradition was published abroad though banned in the Soviet Union He was awarded a Nobel prize but obliged to decline it
- Pasteur, Louis** (1822-95) French chemist whose work was inspired by an interest in the chemistry of life His researches on fermentation led to the science of bacteriology and his investigations into infectious diseases and their prevention to the science of immunology The pathological-bacteriological import of his researches came about mainly through his disciples (Lister Pouch and others) and not directly though all founded on his early non medical investigations on organisms of fermentation etc which were of great importance in industry and fundamentally He spent most of his life as director of scientific studies at the Ecole Normale at Paris The Institute Pasteur was founded in 1888 See also Immunology
- Section F**
- Patmore Coventry** (1823-96) English poet *The Angel in the House* deals with domesticity Later he became a Roman catholic and *The Unknown Eros* is characterised by erotic mysticism
- Patrick St** (c 389-c 461) apostle of Ireland was born in Britain or Gaul and after some time on the continent (taken thither after his capture by pirates) went as missionary to Ireland where after years of teaching and a visit to Rome he fixed his see at Armagh He wrote *Confessions*
- Paul Adelina** (1848-1919) coloratura soprano b in Madrid of Italian parents and of international reputation
- Paul St** (c A.D. 10-c 67) Jew to whom was mainly due the extension of Christianity in Europe B Tarsus (in Asia Minor) he was a Pharisee and became converted about A.D. 37 His missionary journeys took him to the Roman provinces of Asia Macedonia and Greece (Rome had already had Christian teaching) and his epistles form nearly half the New Testament and were written before the gospels He helped to develop both the organisation of the early church and its teaching The date order of his epistles is to some extent conjectural It is believed that he was executed in Rome His Hebrew name was Saul
- Paul VI** (Giovanni Battista Montini) (b 1897) elected Pope in 1963 on the death of John XXIII He was formerly archbishop of Milan He visited the Holy Land in 1964
- Pavlov Ivan Petrovich** (1849-1936) Russian physiologist known for his scientific experimental work on animal behaviour particularly conditioned reflexes and the relation between psychological stress and brain function Nobel prizewinner 1904
- Pavlova Anna** (1885-1941) Russian ballerina b St Petersburg excelling in the roles of *Casside* and *The Dying Swan*
- Peabody, George** (1795-1889) American philanthropist a successful merchant who lived mainly in London He supported exploration and education
- Peacock, Thomas Love** (1785-1866) English novelist b Weymouth His work which is mainly satirical includes *Headlong Hall* and *Nightmare Abbey*
- Pearson, Lester Bowles** (b 1897) Canadian politician served as minister for external affairs 1948-57 and prime minister 1963-8 He has supported the United Nations Nobel peace prize 1957
- Pearry Robert Edwin** (1850-1920) American arctic explorer, discoverer of the north pole (1909)
- Peel Sir Robert** (1788-1850) English Conservative statesman b in Lancashire son of a manufacturer He first held office in 1811 With Wellington he enacted toleration for Roman Catholics in 1829 As home secretary he reorganised London police He developed a new policy of Conservatism and in 1846 largely as a result of the Irish famine he repealed the corn laws which protected English agriculture He died from a riding accident
- Peirce Charles Sanders** (1839-1914) American philosopher founder of the theory of pragmatism which was later developed by his friend William James See Pragmatism
- Section J**
- Penfield Wilder Graves** (b 1891) Canadian brain surgeon author of *The Cerebral Cortex of Man* *Epilepsy* and *The Functional Anatomy of the Human Brain*
- Penn William** (1644-1718) English Quaker and founder of Pennsylvania The son of Admiral William Penn he persisted in becoming a Quaker and on receiving for his father's services a crown grant in North America he founded there Pennsylvania He wrote *No Cross No Crown*
- Penney Baron** (William George Penney) (b 1909) British scientist After 23 years in atomic research and development he returned to academic life in 1967 to become Rector of Imperial College His nuclear research team at A.E.A. developed the advanced gas cooled reactor (A.G.R.) chosen for the Dungeness B and Hinkley Point B power stations
- Pepys Samuel** (1633-1703) English diarist and naval administrator His diary 1660-69 was kept in cipher and not deciphered till 1825 It gives vivid personal details and covers the plague and fire of London (The first complete and unexpurgated version of the diary was issued in 1970)
- Pereda, José Maria de** (1833-1906) Spanish regional novelist (around his native Santander)
- Perez Galdós, Benito** (1843-1920) Spanish novelist and dramatist who has been compared to Balzac for his close study and portrayal of all social classes especially in the series of 46 short historical novels *Episodios nacionales* His longer novels *Novelas españolas contemporáneas* some of which are translated number 31
- Pergolesi Giovanni Battista** (1710-36) Italian composer best known for his humorous opera *La Serva Padrona* and his *Stabat Mater*
- Percles (c 490-420 B.C.)** Athenian statesman general and orator who raised Athens to the point of its fullest prosperity and greatest beauty with the Parthenon Erechtheum and other buildings but he died in the plague which followed the outbreak of the Peloponnesian war
- Perkin Sir William Henry** (1838-1907) English chemist b London who while seeking to make a substitute for quinine discovered in 1856 the first artificial aniline dye mauve His son W.H. Perkin (1860-1929) was an organic chemist of note
- Perrin Francis** (b 1901) French scientist and socialist succeeded Joliot Curie as High Commr of Atomic Energy 1951- professor of Atomic Physics Collège de France 1946- Nobel prizewinner 1926
- Persius Flaccus Aulus** (A.D. 34-62) Roman satunist and Stoic philosopher
- Perugino Pietro** (1446-1524) Italian artist He worked in the Sistine Chapel at Rome and he taught Raphael
- Pestalozzi Johann Heinrich** (1746-1827) Swiss educational reformer whose theories laid the foundation of modern primary education His teaching methods were far in advance of his time He wrote *How Gertrude Educates Her Children*
- Pétain, Henri Philippe** (1856-1951) French general and later collaborator In the first world war he was in command at Verdun and between the wars he sponsored the Maginot line In the second world war when French resistance collapsed he came to terms with Germany and headed an administration at Vichy After the war he was sentenced to life imprisonment

In the Netherlands his strict Roman Catholic policy provoked a revolt which ended in 1579 in the independence of the United Provinces. He married Mary Tudor of England and after her death sent the ill-fated Armada against Elizabeth in 1588.
- Philip V of Spain** (1683-1746) first Bourbon king succeeded his uncle Charles II and was grandson of Louis XIV. His accession provoked European war.
- Philip Arthur** (1738-1814) first governor of New South Wales. Under his command the first fleet of 717 convicts set sail from Britain to Australia and with the founding of Sydney in 1788 colonisation of the whole country began.
- Philips** Stephen (1868-1915) English poet who wrote verse dramas including *Paolo and Francesca*.
- Piast** first Polish dynasty in Poland until the 14th cent. and until the 17th cent. in Silesia.
- Piazzi** Giuseppe (1746-1826) Italian astronomer who discovered Ceres the first of the asteroids to be seen by man.
- Picasso** Pablo Ruiz (b. 1881) Spanish painter b. Málaga received his early training in Catalonia and settled in Paris in 1903. He and Braque were the originators of Cubism (c. 1909). His influence over contemporary art is comparable with that exercised by Cézanne (q.v.) over the artists of his time. Perhaps the best known single work is his mural *Guerca* painted at the time of the Spanish civil war expressing the artist's loathing of fascism and the horrors of war. His genius has also found scope in sculpture, ceramics and the graphic arts and he has designed decor costumes for the ballet.
- Picard** Auguste (1834-1902) Swiss physicist noted for balloon ascents into the stratosphere and for submarine research. In 1900 his son Jacques made a descent of over 7 miles in the Marianas trench in the western Pacific in a bathyscaphe designed and built by his father.
- Pilsudski** Joseph (1867-1985) Polish soldier and statesman who in 1919 attempted by force to restore Poland's 1772 frontiers but was driven back. From 1926 he was dictator.
- Pindar** (522-443 B.C.) Greek lyric poet.
- Pinter** Sir Arthur Wing (1925-1994) English dramatist whose plays include *Daddy Dick*, *The Second Mrs. Tanqueray* and *Mid Channel*.
- Prandello** Luigi (1867-1936) Italian dramatist and novelist whose plays include *Six Characters in Search of an Author*. Nobel prizewinner 1934.
- Pissarro** Camille (1830-1903) French impressionist painter of landscapes studied under Corot.
- Pitman** Sir Isaac (1813-97) b. Trowbridge English inventor of a system of phonographic shorthand.
- Pitt** William (1759-1806) English statesman. Younger son of the Earl of Chatham he entered parliament at 21 and became prime minister at 24 in 1783 when parties were divided and the American war had been lost. He rose to the position and held office with scarcely a break till his death. An able finance minister he introduced reforms and would have gone further but Napoleon's meteoric rise obliged him to lead European allies in a long struggle against France. He died worn out by his efforts.
- Pius XII** (1876-1958) elected Pope 1959. As Eugenio Pacelli he was papal nuncio in Germany and later papal secretary of state. It has been argued that as Pope in wartime he could have taken a stronger line against Nazi war crimes.
- Pizarro** Francisco (c. 1478-1541) Spanish adventurer b. Trujillo after Columbus's discovery he conquered Peru for Spain overthrowing the Inca empire. He was murdered by his men.
- Planck** Max (1857-1947) German mathematical physicist b. Kiel whose main work was on thermodynamics. In 1900 he invented a mathematical formula to account for some properties of the thermal radiation from a hot body which has since played an important role in physics. Nobel prizewinner 1918. See Quantum theory F13.
- Plato** (427-347 B.C.) Athenian philosopher pupil of Socrates teacher of Aristotle. He founded a school at Athens under the name of the Academy where he taught philosophy and mathematics. His great work is his *Dialogues* which includes the *Republic*, the longest and most celebrated. His known writings have come down to us and constitutes one of the most influential bodies of work in history. See also Mind and Matter Section J.
- Playfair** 1st Baron (Lyon Playfair) (1818-98) a far-sighted Victorian who stood for the greater recognition of science in national life. He forsook his profession as professor of chemistry at Edinburgh to enter parliament. Pres. British Association 1885.
- Plimsoll** Samuel (1824-98) English social reformer b. Bristol. He realised the evil of overloading unseaworthy ships and as M.P. for Derby he procured the passing of the Merchant Shipping Act 1876 which imposed a line (the Plimsoll Mark) above which no ship must sink while loading.
- Pliny the Elder** (A.D. 23-79) Roman naturalist author of a *Natural History*. He died of fumes and exhaustion while investigating the eruption of Vesuvius. His nephew Pliny the Younger (A.D. 62-113) wrote *Letters* notable for their charm and the insight they give into Roman life.
- Plotinus** (c. 203-c. 262) Greek philosopher was the founder of Neoplatonism which had considerable influence on early Christian thought. See also God and Man Section J.
- Plutarch** (c. 46-120) Greek biographer whose *Lives* portray 46 leading historical figures (in pairs a Greek and a Roman whose careers were similar). - Wilcox Ella Wheeler** (1855-1919) American writer of romantic sentimental verse
- Wilde Oscar Fingall** (1854-1900) Irish author and dramatist son of a Dublin surgeon and leader of the cult of art for art's sake His works include poems fairy tales short stories and witty comedies—*Lady Windermere's Fan A Woman of No Importance The Ideal Husband and The Importance of Being Earnest* In a libel action he was convicted of homosexual practices and imprisoned for two years when he wrote *The Ballad of Reading Gaol*
- Wilder Thornton** (b 1897) American author and playwright Among his books are *The Bridge of San Luis Rey* and *Ides of March*
- Wilkes John** (1727-87) English politician A Whig he violently attacked George III in his paper the *North Briton* and as a result of unsuccessful proceedings against him general warrants were determined illegal He was again in trouble for obscene libel his defiance of authority brought him popularity and he was four times re-elected to parliament but refused his seat until his opponents gave way His motives were mixed but he helped to establish freedom of the press
- Willcocks Sir William** (1852-1932) British engineer b India who carried out irrigation works in India Egypt South Africa and Mesopotamia He built the Aswan dam (1888-1902)
- Willet William** (1856-1915) English advocate of daylight savings adopted after his death
- William I of England** (1027-87) the Conqueror Duke of Normandy claimed the English throne as successor to Edward the Confessor and defeated Harold II at Hastings in 1066 An able commander and a firm ruler he crushed Saxon resistance especially in the north transferred most of the land to his Norman followers and drew England into closer relations with the continent as did his archbishop Lanfranc He ordered the Domesday survey (see LBP)
- William II of England** (1066-1100) the Godscoroner a son surnamed Rufus succeeded in 1157 Cupiduous and self-indulgent his reign

- was troubled and he was shot (by accident or design) while hunting in the New Forest
- William III of England** (1650-1702) King of England Scotland and Ireland (1689-1702) son of William II of Orange and Mary daughter of Charles I. He married Mary daughter of the Duke of York (later James II) while stadtholder of Holland. In 1688 when James had abdicated and fled the country he was invited to succeed and he and Mary became joint king and queen. The revolution of 1688 brought to England tolerance of Protestant worship but William was mainly concerned with war against France brought to an end in 1697
- William IV of England** (1765-1837) third son of George III succeeded his brother George IV in 1830 and was called the sailor king. In his reign the parliamentary reform bill of 1832 and other reform measures were carried without obstruction from him
- William I of Germany** (1797-1888) King of Prussia and first German emperor. He succeeded to the throne in 1861 and continued resistance to reform appointing Bismarck as chief minister and supporting him through the Austro-Prussian and Franco-Prussian wars. His personal character was simple and unassuming
- William II of Germany** the Kaiser (1859-1941) King of Prussia and German emperor from 1888 was grandson of William I and of Queen Victoria. He was intelligent but impetuous and believed in military power. He dismissed Bismarck. In 1914 his support of Austria helped to precipitate European war and the resulting defeat brought his abdication after which he lived in retirement at Doorn in Holland
- William the Silent** (1533-1584) Dutch national leader. Prince of Orange he led the revolt of the Protestant Netherlands against the rule of the Spanish Philip II. The union of the northern provinces was accomplished in 1579 and Spanish rule was renounced by 1584 in which year William was assassinated
- Williams Sir George** (1821-1905) founder of the Young Men's Christian Association
- Williams Emlyn** (b 1905) Welsh actor play writer and producer author of *Night must Fall*, *The Corn is Green* and *The Light of Heart*. He has also given readings from Dickens and Dylan Thomas
- Wilson James Harold** (b 1916) British Labour statesman. He entered parliament in 1945 as member for Ormskirk and was elected for Huyton in 1950. He became leader of the Labour Party in 1963 after the death of Gaitskell and was prime minister 1964-70. His government enacted a series of social reforms and succeeded in strengthening Britain's international economic position but courted unpopularity by taking the necessary restrictive measures. Faced with Rhodesian U.D.I. he tried to keep open negotiations without compromising on principle. He refused to send troops to Vietnam and to supply arms to South Africa. He prepared for entry into the European Economic Community
- Wilson Richard** (1714-82) British landscape painter b Montgomeryshire who pioneered a freer style than the old classicism
- Wilson Thomas Woodrow** (1856-1924) American statesman. He was U.S. president 1913-21 brought America into the first world war and advocated the League of Nations but was not a successful negotiator at the peace conference and could not carry his country into the League. His administration introduced prohibition and women's suffrage
- Wingate Orde Charles** (1909-44) leader of the Chindit forces engaged behind the Japanese lines in Burma during the second world war
- Winifred St.**, the 7th cent. patron saint of North Wales said in late legend to have been killed by her rejected suitor Prince Caradoc but restored by her uncle
- Wiseman Nicholas Patrick** (1802-65) cardinal b. in Spain of an Irish family. In 1850 on the restoration in England of the Roman Catholic hierarchy he became first archbishop of Westminster and reorganised and developed his church in Great Britain
- Wodehouse Pelham Grenville** (b 1881) English humorist creator of Jeeves in the Bertie Wooster stories. He is now an American citizen
- Wolf Friedrich August** (1790-1824) German classical scholar a founder of scientific classical philology
- Wolf Hugo** (1860-1903) Austrian song writer. In his settings of over 300 German lyrics including many of Morike and Goethe he achieved complete union of poetry and music. See Section E
- Wolfe James** (1727-59) British general b. Westsaham. He showed early promise in the Seven Years War and was given command of the expedition against Quebec which in spite of its strong position he captured but lost his life
- Wolsey Thomas** (c 1475-1530) English cardinal. A butcher's son at Ipswich he entered the church becoming archbishop of York and cardinal while in the same year (1515) he became Henry VIII's lord chancellor. He was thus powerful and wealthy and he founded Christ Church (Cardinal) College Oxford. But in spite of his ability he was unable to secure papal sanction for the king's divorce from Catherine of Aragon and fell from power and died
- Wood Sir Henry Joseph** (1869-1944) English conductor founder of the Promenade Concerts which he conducted from 1900 till his death
- Woodcock George** (b 1904) English trade union leader. T.U.C. general secretary 1960-69. He is chairman of the Commission on Industrial Relations set up by the Labour government in 1969
- Woodville Elizabeth** (1437-91) wife of Edward IV. Her daughter Elizabeth married Henry VII
- Woolf Virginia** (1882-1941) English writer daughter of Sir Leslie Stephen and wife of Leonard Woolf with whom she founded the Hogarth Press. Her works develop the stream of consciousness technique and include *To the Lighthouse*, *Mrs Dalloway*, *The Waves*, *A Room of One's Own*. See Section M Part I
- Woolley Sir Richard van der Riet** (b 1906) succeeded Sir Harold Spencer Jones as astronomer royal (England) in 1956
- Wootton of Abinger Baroness** (Barbara Frances Wootton) (b 1897) English social scientist chairman Metropolitan Juvenile Courts 1948-62 deputy speaker of the House of Lords 1963. Her works include *Social Science and Social Pathology*, *Crime and the Criminal Law* and an autobiography *In a world I never made*
- Wordsworth William** (1770-1850) English poet b. Cockermouth. He went to Cambridge and in 1798 with Coleridge issued *Lyrical Ballads* a return to simplicity in English poetry. He settled at Grasmere with his sister Dorothy (1771-1855) to whose insight his poems owe much. Among his best works are the sonnets and his *Ode on the Intimations of Immortality* besides his *Prelude*
- Wren Sir Christopher** (1632-1723) English architect b. Wiltshire. After the great fire (1666) he prepared an abortive plan for rebuilding London but did in fact rebuild St Paul's and more than fifty other city churches including St Stephen Walbrook and St Mary le Bow. Other works include Chelsea Hospital, portions of Greenwich Hospital, the Sheldonian theatre Oxford and Queen's College Library Oxford. He had wide scientific interests (he was professor of mathematics at Gresham College London and professor of astronomy at Oxford) and helped to found the Royal Society
- Wright Frank Lloyd** (1869-1959) American architect initiator of horizontal strip and all glass design. His influence has spread over the world. His buildings include the Imperial Hotel Tokyo and the Guggenheim Museum New York
- Wright Orville** (1871-1948) American airman who with his brother Wilbur (1837-1912) in 1903 was the first to make a controlled sustained flight in a powered heavier than air machine flying a length of 852 ft at Kitty Hawk, N.C.
- Wyatt James** (1746-1813) English architect who built Fonthill Abbey
- Wyatt Sir Thomas** (1603-42) English poet who introduced the sonnet from Italy. He was also a diplomat
- Wyatt Sir Thomas the younger** (c 1520-54) son of above, unsuccessfully led a revolt against Queen Mary on behalf of Lady Jane Grey
- Wycherley William** (1640-1715) English drama

- tist of the Restoration period. A master of satiric comedy, his plays include *Love in a Wood*, *The Plain Dealer*, and (the best known) *The Country Wife*.
- Wyclif John** (c 1320-84) English religious reformer. He taught at Oxford later becoming rector of Lutterworth. He insisted on inward religion and attacked those practices which he thought had become mechanical. His followers called Lollards were suppressed partly for political reasons. The Wyclif Bible the first and literal translation of the Latin Vulgate into English was mainly the work of his academic followers at Oxford.
- Wykeham William** of (1324-1404) English churchman. He held office under Edward III and became bishop of Winchester in 1367. He founded New College Oxford and Winchester School and improved Winchester cathedral.
- Wyllie William Monell** (1851-1931) English marine painter of *The Thames Below London Bridge*.
- Wyspianiec Stanislaw** (1860-1907) Polish poet, dramatist and painter. His plays *The Wedding Liberation* and *November Night* treat of national themes.

X

- Xavier St Francis** (1506-52) apostle of the Indies. b at Xavero in the Basque country. He was associated with Loyola in founding the Jesuits and undertook missionary journeys to Goa, Ceylon and Japan. He died while planning another to China.
- Xenophon** (444-359 B.C.) Athenian general and historian. He commanded Greek mercenaries under the Persian Cyrus and on the latter's death safely marched the Ten Thousand home through hostile country. His chief works are the *Anabasis*, the *Hellenica* and *Cyropaedia*.
- Xerxes** (c 519-465 B.C.) King of Persia was son of the first Darius. In 481 B.C. he started on an expedition against Greece when according to Herodotus he had a combined army and navy of over two and a half million men. He defeated the Spartans at Thermopylae but his fleet was overcome at Salamis. He reigned from 485 to 465 B.C. and met his death by assassination.
- Ximenes de Cisneros Francisco** (1486-1517) Spanish statesman and churchman. He became cardinal in 1507, carried out monastic reforms and directed preparation of a polyglot bible the *Complutensian*, but as inquisitor general he was fatalistic against heresy. He was adviser to Queen Isabella in 1506, regent for Queen Juana and himself directed an expedition to conquer Oran and extirpate piracy.

Y

- Yeats William Butler** (1865-1939) Irish lyric poet and play writer. b near Dublin a leader of the Irish literary revival. His plays were performed in the Abbey Theatre (which with Lady Gregory (1852-1932) he helped to found) and include *Cathleen Ní Houlihan*, *The Hour Glass* and *Deirdre*. His poetry is discussed in Section M Part II. A complete edition of the *Collected Poems* appeared in 1950.
- Yonge Charlotte Mary** (1829-1901) English novelist. Influenced by Keble she wrote novels which faithfully reflect some aspects of Victorian life, one such is *The Daisy Chain*. She also wrote historical fiction such as *The Dove in the Eagle's Nest*.
- Young Brigham** (1801-77) American Mormon leader and president in 1844 after the founder's death. He was a main founder of Salt Lake City. He practised polygamy. See also *Mormonism* Section J.
- Young, Francis Brett** (1884-1954) English novelist author of *My Brother Jonathan* and *Dr Bradley remembers*.
- Young, James** (1811-83) Scottish chemist. b Glasgow whose experiments led to the manufacture of paraffin oil and solid paraffin on a large scale.

- Young Thomas** (1773-1829) English physiologist, physician and Egyptologist. b Somerset of Quaker family. He established the wave theory of light and its essential principle of interference put forward a theory of colour vision and was the first to describe astigmatism of the eye. He was also largely responsible for deciphering the inscriptions on the Rosetta stone.
- Youghusband Sir Francis Edward** (1863-1942) English explorer and religious leader. He explored Manchuria and Tibet and wrote on India and Central Asia. He founded the World Congress of Faiths in 1936 (see Section J).
- Ypres 1st Earl of** See French.
- Ysaie Eugene** (1858-1929) Belgian violinist and conductor noted chiefly for his playing of the works of Bach and Cesar Franck.
- Yukawa Hideki** (b 1907) Japanese physicist who received the 1949 Nobel prize for predicting (1935) the existence of the meson.

Z

- Zadkiel** (angel in rabbinical lore) pseudonym of two astrologers. William Lilly (1602-81) and Richard James Morrison (1794-1874).
- Zadkine Ossip** (b 1890) Russian sculptor in France who makes play with light on concave surfaces. His works include *Orpheus* and the public monument *The Destruction of Rotterdam*.
- Zaharoff Sir Basil** (1849-1936) armaments magnate and financier. b Anatolia of Greek parents. He was influential in the first world war.
- Zamenhof Ludwik Lazarus** (1859-1917) Polish Jew who invented Esperanto. He was by profession an oculist.
- Zeno of Citium** (342-270 B.C.) philosopher, founder of the Stoic system. He left Cyprus to teach in Athens.
- Zeppelin Ferdinand Count von** (1838-1917) German inventor of the dirigible airship 1897-1900. It was used in the first world war.
- Zeromski Stefan** (1864-1929) Polish novelist, author of *The Homeless*, *The Ashes*, *The Fight with Satan*.
- Zhukov Georgi Konstantinovich** (b 1896) Soviet general who led the defence of Moscow and Stalingrad and lifted the siege of Leningrad in the second world war and accepted the German surrender in 1945. He continued to be active till 1967.
- Zhukovsky Vasily Andreyevich** (1783-1852) Russian poet and translator of German and English poets. For many years he was tutor to the future Tsar Alexander II.
- Zola Emile Edouard** (1840-1902) French novelist. b Paris of Italian descent. His series *Les Rougon Macquart* portrays in a score of volumes the fortunes of one family in many aspects and in realistic manner. He had the moral courage to champion Dreyfus.
- Zorn Anders Leonhard** (1860-1920) Swedish sculptor, etcher and painter.
- Zoroaster (Zarathustra)** (fl 6th cent B.C.) Persian founder of the Parsee religion. He was a monotheist and saw the world as a struggle between good (Ahura Mazda) and evil (Ahriman). See *Zoroastrianism* Section J.
- Zoshchenko, Mikhail** (1895-1958) Russian writer of humorous short stories which include *The Woman who could not Read* and *other Tales* and *The Wonderful Dog* and *other Stories*.
- Zosimus** (fl c 300) the first known alchemist. He lived in Alexandria.
- Zuccarelli Francesco** (1702-88) Italian artist of fanciful landscapes. He spent many years in London and was elected a founder member of the R.A. (1768).
- Zuckermann Sir Solly** (b 1904) British biologist, chief scientific adviser to British governments. His publications include *Scientists and War* and *The Frontiers of Public and Private Science* O.M. 1968.
- Zwingli, Ulrich** (1484-1531) Swiss religious reformer. He taught mainly at Zurich where he issued a list of reformed doctrines less extreme than those of Calvin.
- Zwinger Ernst Friedrich** (1802-61) German architect who restored Cologne cathedral.

BACKGROUND TO PUBLIC AFFAIRS

This section is in two parts. The first is a narrative of political events in Britain since the war and of some significant events around the world. The second part explains the structure of our own political institutions and the main international ones.

BACKGROUND TO PUBLIC AFFAIRS

This section is in two parts. The first describes some major events since the war and carries the story to 1971. The second part describes our own political institutions: the Commonwealth, the United Nations, Western and other International Organisations.

I NARRATIVE OF POLITICAL EVENTS

BRITAIN POLITICAL BACKGROUND

Brief Historical Survey

The end of the Great War marked a watershed in British political life. The Representation of the People Act of 1918 gave the vote to all men over the age of 21 and to women over 30; the franchise being extended to women over 21 in 1928. Thus began a new era of mass participation in politics. The newly enfranchised working classes were catered for by a specifically working class party, the Labour party, and the next decades were to see the virtual eclipse of the other radical party, the Liberals. However from the mud of Flanders Britain moved into the quagmire of economic depression, each government no matter what its political hue seeming to be in the grip of economic forces beyond its control.

Effective demand for goods remained year in year out far below the productive capacity of the economy and as a result unemployment was always high. Between 1921 and 1939 it never dropped below the million mark, and in the depths of the world slump in 1932 it nearly reached 3 million out of a total insured labour force of 12.5 million. One worker in four was out of a job and in some of the depressed areas it was nearer one in three. Even the rearmament drive of 1937-8 failed to end the depression, though it did bring some revival of demand for the products of heavy industry and it was not until 1940 that unemployment finally disappeared.

In the inter war period Britain had considered its unemployment not been too badly off for three main reasons. First we had long been industrialised so that the chronic under investment of the period in the means of production had not the effects it would have had on a nation with out our stock of capital goods. Second although throughout the period we were losing ground in overseas markets to our competitors the terms of trade grew more favourable for us so that the same volume of exports could pay for a far higher volume of imports than it could have done in 1913—or than it has ever done since the war. That was not much comfort to those dependent for their living on an exporting industry but it did mean that falling exports brought no serious balance of payments problems. And third in those days Britain was still the owner of vast overseas assets which brought in a steady large investment to pay for imports and which could if necessary be drawn on to finance any deficit in the balance of payments.

The Effect of the War

The war changed all this. The export trade was slashed to a third of its pre war level, the overseas assets were sold off and large debts incurred in their place. Investment in and even maintenance of capital goods had to be put off. Finally the war brought to an end the favourable turn in the terms of trade. In 1945 they were much worse than in 1938 and from 1945 to 1951 they steadily turned against us.

As a result the first five years after the war were years of chronic excess of demand—of demand for more investment to make good the neglect of decades of demand for more consumption to bring to an end the austerity of wartime and to

allow families to replenish their depleted stocks of household goods and of demand for exports to meet the unfavourable turn in the terms of trade and to allow us to start paying off the debts incurred in the war. Immediately the problem was an impossible one: without American aid we would have been bankrupt. But gradually as production picked up demand began to come under control once more and it did seem as if by 1950 the most pressing immediate problems had been successfully surmounted. There were still many relics of the war—housing was still inadequate, the roads and railways were neglected, rationing was still with us, prices were not yet stable and there were still shortages of many important materials.

Attlee's First Labour Government

The Labour party left the National government after the overthrow of Germany in May 1945 rejecting overtures from Churchill to continue the coalition. Faced with this re-emergence of party politics the caretaker government had no choice but to call a general election to ascertain which party should lead the nation along the path to peace. The Conservative party campaigned on the slogan 'Let Churchill finish the job'. Labour on a vigorous programme of social and economic reform. The electorate remembering the dismal thirties and perhaps intuitively recognising Churchill's greatness as a warrior but his unsuitability to lead in time of peace as well as desiring radical social changes returned Clement Attlee with a majority of 146 over all other parties. The Labour party became the majority party for the first time in its history (on its two previous occasions in office 1924 and 1929-31 it was dependent upon Liberal support). The Conservatives with 213 seats fell to their lowest ebb since 1906 and the Liberals formerly one of the two great parties captured only 12 seats.

The cabinet (of 20) included Ernest Bevin (Foreign Secretary) former docker and leader of the Transport and General Workers Union, Aneurin Bevan (Minister of Health) ex miner from South Wales, Herbert Morrison (Lord President of the Council and deputy Prime Minister), Ellen Wilkinson (Minister of Education), Hugh Dalton (Chancellor of the Exchequer), Sir Stafford Cripps (President of the Board of Trade), Harold Wilson and Hugh Gartskeill junior ministers at the Ministries of Public Works and Fuel and Power respectively. Both Oxford economists were later to become leaders of their party. The Prime Minister himself, Clement Attlee, educated at Haileybury and Oxford had done social work in the East End of London, becoming Mayor of Stepney before entering parliament in 1922. To these men fell the task of shaping post war Britain.

Although Britain emerged from the war with new industries ready for expansion and a much increased labour force much of her pre war capital wealth had been destroyed and urgent action was required to replace worn out capital equipment and turn industrial resources to peace time production. To conserve vital resources a programme of rationing and austerity was introduced. Both trade unions and manufacturers cooperated in holding down wages and

prices the former at least encouraged by the economic and social reforms of the new government.

Public Ownership

The Labour party was doctrinally committed to some degree of nationalisation though the exact amount was and is a matter of dispute within the party. One of its first acts in 1946 was to nationalise the Bank of England. This had previously been subject to a high degree of central control and little objection was raised by the Opposition. The nationalisation of the coal industry the same year excited more debate. However this industry even before the war had been subject to governmental intervention and during the war had been stripped of its capital and worn out machines not having been replaced. It is significant here that the form of public ownership was not that of a government department nor control by workers but responsibility was vested in a semi independent public board, the National Coal Board. This showed the essentially moderate pragmatic nature of the nationalisation programme which continued with the taking into public ownership by 1951 of the electricity and gas supply services, the railways, the ports and docks, a large section of road goods transport and some road passenger transport, the canals, the major part of civil aviation, the cable and wireless services, and the major part of the iron and steel industry. The Conservatives after their return to power in 1951 denationalised iron and steel and the major part of the nationalised road goods transport service but left the other nationalisations undisturbed though they in certain respects altered the administrative structure set up by the Labour government.

Building the Welfare State

The immediate post war years saw the laying of the foundations of the welfare state. The provisions of the Butler Education Act of 1944 were put into operation greatly expanding facilities and improving the opportunity for each child no matter what its background to enjoy the benefits of higher education. Child allowances were introduced along with a rise in old age pensions. For a long time doctors and others who had studied the subject of medical care had felt that a national medical service was essential in order to make the best use of hospitals and to bring the full range of modern medicine within the reach of everyone. It was to meet these needs that the National Health Service Act was passed in 1946. The new health service came into operation in July 1948 and proved to be one of the greatest experiments in health care ever undertaken and was watched critically by countries all over the world. For the first time in our history every man, woman and child in the country was entitled to free medical care.

Measures were also taken relating to the distribution of industry so as to avoid the pockets of unemployment in certain areas. All this added up to a fundamental restructuring of British society comparable only to the Liberal reforms of 1906-14.

Foreign Affairs

When the war ended there was still an abundance of goodwill towards the Soviet Union, but a number of political factors worked the other way and it was allowed to evaporate. As Churchill put it in his famous speech at Fulton, Missouri (1946): "From Stettin on the Baltic to Trieste on the Adriatic an Iron Curtain has descended across the continent. The failure of the nations to make treaties of peace or arrangements for general disarmament and the continuing loss of confidence between the Soviet Union and the West led to an increase of armaments and defensive pacts on both sides. The United States and Western Europe formed the North Atlantic Treaty Organisation (NATO) and the Russians on their side organised the communist countries by a Warsaw Pact. The old system of a balance of power centred on Europe had col-

lapsed to give way to a new period in world politics dominated by the two great power blocs, the United States and the Soviet Union and based on nuclear deterrence. See also C41 C38.

In the Middle East Britain was one of the guarantors of the new state of Israel, carving out land where the Jewish population could settle. The land was taken from the Arabs with what consequences the Arab-Israeli war of June 1967 showed. See C12.

Of our former colonies, India (1947), Burma (1948) and Ceylon (1948) received their independence. Burma while maintaining the closest links with Britain decided not to follow the example of India and left the Commonwealth.

Attlee's Second Government and the Korean War

By 1950 the electorate had lost much of its enthusiasm for radical change and the government having passed its most important measures was running out of steam. This possibly explains why a government which had not lost a single by-election was returned with a majority of only six. Among the new men returned for the Conservative party in this parliament were Edward Heath, Iain Macleod, Reginald Maudling and Enoch Powell all four to become ministers and Mr Heath a prime minister. The government struggled on handicapped by its small majority and facing the problems of the Korean war which put an end to any impression that the economy was under control. Prices of raw materials and food shot up and a large favourable balance on international trade rapidly turned into a far larger unfavourable balance. A serious price inflation got under way and the policy of wage restraint collapsed. On top of that came the rearmament programme to meet the military threat of communism. Gaitskill who had succeeded the dying Cripps at the Exchequer imposed charges on dentures and spectacles supplied under the national health service which led to the resignation of Aneurin Bevan, the minister who had piloted the scheme through all its stages in parliament. John Freeman later to become British Ambassador to Washington and Harold Wilson then President of the Board of Trade, Attlee asked for a dissolution and an election in October 1951.

The Conservatives Regain Power 1951

The Labour party secured the highest total poll that it or any other party had received in a general election—14 million votes. The Conservatives received a quarter of a million less but they secured a majority of seats. This anomaly was due to the peculiarities of the electoral system which piles up large (and useless) majorities for both sides in safe seats. The new cabinet was led by Churchill and was mainly composed of his old war time colleagues with Sir Anthony Eden at the Foreign Office, Harold Macmillan at the Ministry of Housing and Local Government, Walter Monckton at the Ministry of Labour, Lord Cherwell as Paymaster General and R. A. Butler later twice to be denied the highest prize of the leadership, the new Chancellor.

The balance of payments crisis which reached its peak in the last months of 1951 just after the defeat of the Labour government was rapidly brought under control largely because the prices of raw materials fell almost as quickly as they had risen but also through the imposition of severe import controls. The unannounced though very real abandonment of the grandiose rearmament targets also helped. For this control there was however a price to pay—a recession in industry particularly in textiles but also in a number of consumer durable industries which brought the first serious though limited return to unemployment. But as import prices continued to fall the government soon felt able to take steps to re-expand demand. A more ambitious housing programme was underway and rationing was being abolished.

George VI died in February 1952. He had succeeded to the throne in difficult circumstances when his elder brother King Edward VIII had abdicated in order to marry Mrs Wallis Simpson, an American. George VI had done much to

restore the high esteem in which the monarchy is held in Britain notably by his courage in staying in London during the Blitz and visiting the bombed areas. His death in 1952 was followed by a period of national mourning—He was father to us all—was a frequent comment of the times showing both the sense of loss at his death and the degree to which the life of the royal family has become identified with that of the individual subject. The coronation of his daughter Queen Elizabeth II followed in June 1953. On the same day as she was crowned a British expedition climbed Everest and there were high hopes that a new Elizabethan age was dawning.

The Retirement of Churchill

On 5 April 1955 Sir Winston Churchill handed over the great seal of office for the last time in a career in politics spanning over half a century during which he had served two great parties risen to high office fallen returned to lead his country in her finest hour been rejected finally to return in a peace time prime minister. The finest orator of his day his bulldog stubbornness had been an inspiration during the war. In 1954 he was accorded an honour unique in the annals of British parliamentary history—the presentation by the Commons of a book signed by all M.P.s and a portrait by Graham Sutherland. Perhaps the best description of this man who held the stage of British politics for so long is provided by the words introducing his work on the Second World War in *War Resolution In Defeat Defence In Victory Magnanimity In Peace*. Good will. His successor as premier was Sir Anthony Eden who had resigned over a difference with Chamberlain in 1938 and gone on to be Churchill's foreign secretary during the war. Eden had been the heir apparent for a number of years and was in terms of the offices he had held well equipped to take over the reins of power. His first action was to lead the Conservative party into the general election of 1955.

The Retirement of Attlee

The Conservatives won the election with an overall majority of 58 seats gaining 49.7 per cent of the vote compared with Labour's 46.4 per cent though there was a fall in turnout of nearly 5 per cent. This gave the Conservatives a comfortable majority to govern with and it seemed as though Eden was set for a long tenure at 10 Downing Street. When parliament assembled four older members including Dalton resigned because of their age from the Labour shadow cabinet and at the end of the year Attlee resigned the leadership.

Attlee had seen the Labour party grow from a party which in 1910 gained 7 per cent of the vote and 42 M.P.s to the party which in 1945 had formed the government and carried through a programme of social and economic reform. If Churchill stood for the finest hour in our history Attlee stood for the social revolution which followed it. He retired to the Lords to become a respected elder statesman until his death in 1967. He was succeeded by Hugh Gaitskell as party leader the first Labour leader born in this century a man determined to remodel socialism to fit the new age of technocracy and welfare capitalism.

The Suez Adventure

This opened in 1956 with the refusal of Britain and the United States despite earlier promises to finance the building of the Aswan High Dam which President Nasser considered necessary for the development of the Egyptian economy. Nasser retaliated by nationalising the Suez Canal. Eden, on his own initiative and without the full approval of all his cabinet acted in concert with France to retake the canal zone by force. An American veto and considerable pressure from the United Nations led to the withdrawal of British troops but a parliamentary storm unparalled since the days of home rule for Ireland blew up. (It was while we were bombing Egypt that Russia suppressed a revolt in her satellite Hungary.) Eden's position was severely under-

mined by this and it led to the resignation of two ministers Anthony Nutting and Sir Edward Boyle. The Prime Minister himself resigned because of ill health early in 1957. The new leader of the party was Harold Macmillan chosen by a process of consultation which by passed the claim of R. A. Butler. See also C12(2).

The Macmillan Years

The struggle for national solvency continued. In 1955 there had been a renewed balance of payments crisis followed by another in 1956 and an even more severe one in 1957 and with each fresh measure of restriction on demand had to be introduced. These stringent measures finally brought the balance of payments under control but as in 1952 the control also brought a recession—rather more severe but still mild by inter war standards. Then as in 1953 the government felt able to take steps to re-expand demand production responded fast and 1958 was a prosperous year. But there were danger signals. Wage demands were beginning to mount and although the reserves were still rising the balance of trade was more unfavourable than in the crisis years of 1956 and 1957.

The country went to the polls in 1959 for the fourth time in the 1950s and for the third time the Conservatives won this time with a handsome overall majority of 100 seats. There was despair in the Labour camp and swift recommitments took place. Gaitskell believed that the party's image was outmoded and in 1960 decided to fight for the abandonment of Clause 4, the nationalisation clause of the party's constitution. This led to a fierce internal struggle between right and left which was followed by a further campaign to get Conference to adopt a motion making unilateral nuclear disarmament the official policy of the British Labour party. Gaitskell promised to fight, fight and fight again to secure the reversal of this decision and succeeded the following year.

In July 1961 the Chancellor of the Exchequer Selwyn Lloyd called for a pay pause in wages salaries and dividend payments. This was the first sign of a prices and incomes policy which was to become the main remedy for inflation in the 1960s. Britain had still not solved its central economic problem—how to reconcile the twin aims of growth and stable prices with a satisfactory balance of payments.

From the middle of 1962 the government seemed dogged by misfortune which it was doubtless hoped would be changed by Britain's entry into the Common Market (see Section G Part IV). Quickly following Britain's exclusion came the hardships of a severe winter and a sudden increase in unemployment. When the spring came the government were caught in another misfortune the Profumo affair involving the resignation of its war minister. This did nothing to still the feeling in the Conservative party that the Prime Minister should make way for a younger man. Macmillan indicated that he hoped to lead the party at the next election. This discordant position was suddenly cut by the Prime Minister's illness which compelled him to resign. By a coincidence his announcement came (10 October 1963) the day after the annual party conference had opened. The resignation would in any event have caused a great debate in the party but he dropped suddenly into the excited atmosphere of a conference it caused a tumult. How confused the situation was is illustrated by the fact that on the very morning when the Queen sent for Lord Home then Foreign Secretary the first headline in *The Times* was 'The Queen may send for Mr Butler today'.

Among other important events of Macmillan's premiership were the explosion of the first British hydrogen bomb, the settlement of the Cyprus dispute, the cancellation of the *Blue Streak* missile programme, and the agreement for U.S. *Polaris* submarines to use Holy Loch, the setting up of the National Economic Development Council, the legalisation of betting shops, the winding up of the Central African Federation, the nuclear test ban treaty, and the establishment of a Federation of Malaysia. A number of Commonwealth countries became independent sovereign states (see K 180).

Death of Hugh Gaitskell

The Labour party had just recovered from the internal strife of the early 1960s and was unified for the first time in a decade when Gaitskell died in 1963 at the age of 57. A man of enormous passion for the underdog he had begun the task of modernising the Labour party and left his successor a legacy of a united party ready to face the challenges of a scientific and technological age. There were three candidates for the succession. George Brown, a former trade unionist who had been very close to Gaitskell and was deputy leader of the party. James Callaghan, another former trade unionist and Harold Wilson, an Oxford economist who had served in Attlee's cabinet. Wilson won.

Election Year 1964

Parliament's legal term expired in the autumn of 1964 but there remained the question whether Sir Alec Douglas-Home, who had renounced his title in 1963, would go to the country in the spring or in the autumn. Concealing his hand till the last moment Sir Alec decided to wait till the autumn. For many months therefore the country discussed the issues involved and thus went through much of the emotions of an election which when it came seemed belated the people being a little weary of worked up turmoil by politicians, press and pollsters. Some of the fire of an election had thus been drawn prematurely but no general election can be a lack drama. The government's majority dissolved and Wilson kept the lead in a photo finish. The resultant position can be seen in the table on a later page. Before leaving this point in our story we must note the coincidence by which within the very two days on which the results came in there occurred two events of world wide importance—the fall of Khrushchev and the explosion by China of an atomic bomb.

Upon accession to office the new government was faced with a prospective balance of payments deficit of £700-800 million for 1964. It was estimated that although there should be a considerable improvement in 1965 the deficit would still be at an unacceptable level. The government therefore took measures aimed first to deal with the immediate deficit and second to begin the task of dealing with the more intransigent underlying economic problems. These measures are discussed under Internal Developments, Section G Part IV.

Changes in the Conservative Party

The loss of the election was a cause of grave concern to the Conservative party and as the opinion polls showed Labour increasing its lead and there were grumblings on the backbenches Sir Alec resigned. One legacy from his brief leadership was a new system of finding a leader of the party. The undignified display at the Blackpool party conference and complaints that some sections of party opinion had not been consulted led to demands for change. An electoral system was introduced the leader being chosen by two bodies: first the parliamentary party and second a group composed of Conservative members of both Houses and the Executive Committee of the National Union. The first leader chosen by the new method was Edward Heath, a man in terms of social background much closer to Mr Wilson than to Sir Alec. Educated at Chatham House School and Balliol College Oxford the new leader of the Opposition had been a foremost proponent of entry to the Common Market and had piloted the Resale Price Maintenance Bill through parliament which abolished the situation whereby manufacturers could prevent retailers from cutting prices if they so desired. This Bill was finally passed under the Labour government but the fact that Mr Heath was prepared to put through a measure which was highly unpopular with his own party showed something of the resolve of the new leader.

The 1966 General Election

Against all the odds and expectations Labour had governed for seventeen months with a

majority over Conservatives and Liberals fluctuating between five and a mere one. Not only that but when parliament was dissolved it was entirely at the Prime Minister's own choosing. Such is the unexpected course of political events. It might reasonably have been held and was indeed maintained by many that no government short of a coalition could exist with a majority of less say than a dozen. But Mr Wilson governed with the air of one commanding a secure majority for he neither trumped his controversial programme nor made the slightest gesture towards a coalition with Liberals. And he maintained this course against particularly severe economic circumstances. Mr Wilson chose to appeal to the country on 31 March 1966 and Labour's recovery was complete. His party gained 47.9 per cent of the vote compared with 41.9 per cent for the Conservatives. On an average swing of 3.5 per cent the overall Labour majority in the House of Commons was 96. The Liberal party gained only 8.5 per cent of the vote though it increased its number of seats to 12. See General Election Results C7.

Unpopular Measures in National Interest

Almost immediately the government was faced with yet another run on sterling and in July adopted a package of deflationary cuts in public spending and introduced a price and incomes freeze. With the cooperation of both sides of industry the measures worked for a time but with sterling coming under almost unremitting pressure our balance of payments position deteriorated and by November 1966 the only alternative to massive deflation and soaring unemployment was devaluation. (See Section G Part IV under International Developments.) Devaluation by reducing the price of our exports and making imports more expensive compared with home produced goods improved our competitive position in the world markets. However the wage-price spiral continued to rise and in July 1968 statutory regulation of prices and incomes was introduced. This piece of legislation was fought tooth and nail by the trade unions and the compulsory provisions were not renewed when they expired at the end of 1969. The deflationary cuts and devaluation marked a new phase in the turn of public opinion and by the end of 1963 the polls were putting Conservatives over 20 per cent in the lead. The middle of 1969 saw the beginnings of a turn round in the economic situation.

Foreign Affairs

The most pressing problem in this field was obtaining a settlement with Rhodesia and Mr Wilson made two dramatic if unavailing attempts to come to agreement with Mr Smith. (This subject is treated more fully in Part II.) In May 1967 Britain put in her second application to join the Common Market and although in the December France voted against negotiations for British membership the application remained on the table. In defence the government decided to abandon the East of Suez policy thus forcing Britain to come to terms with its true position in the world (though the decision was taken on the pragmatic ground of saving defence expenditure). The government refused to supply arms to South Africa in accordance with a United Nations resolution of 1964. The government felt obliged to intervene in Anguilla, a tiny Caribbean island which had unilaterally seceded from the St Kitts union in 1967: it was allegedly becoming a Mafia haunt.

Labour Reforms

A number of important measures were passed in the six years of Labour's rule. On the social front it repealed the Conservative 1957 Rent Act and provided for higher standards in housing, education and the health service. It gave parliamentary time from its crowded schedule to abolish capital punishment and private members' bills on abortion (Abortion Act, 1967), homosexuality (Sexual Offences Act 1967) and divorce (Divorce Reform Act 1969) were carried through by free votes of parliament. Persons Act 1969 made extensive changes in the legal procedures governing young offenders and provided for a comprehensive system of community homes for children in care and strengthened the law on private fostering (see D41-3). A constitutional change of some importance came with the enfranchisement of the 18 year olds in 1970. The Countryside Act 1968 enlarged the functions of the Countryside Commission conferred new powers on local authorities and other bodies for the management of rural areas and provided greater opportunities for leisure and recreational activities in the countryside. It obliged every government department and public authority to have due concern for amenity. Further the government outlawed racial discrimination in the Race Relations Acts 1965 1968 (see D46). In industrial policy the Transport Act 1968 provided for a better integration of road and rail transport and for higher standards in road transport. In regional policy, the introduction of investment grants was to aid the setting up of new industry in depressed areas and reduce the disparity between the regions in terms of unemployment. The setting up of the Law Commission was on the initiative of Lord Gardiner (Lord Chancellor) an enthusiastic reformer and many of its recommendations and fresh legislation resulting from them have been noted under their various headings in Section D e.g. Criminal Justice Act 1967 Criminal Law Act 1967.

The 1970 General Election

By 1970 our balance of payments position had been transformed from a state of chronic deficit to one of healthy surplus. The rise in economic prosperity was reflected in a swing back to the government. This was very welcome to a party which had lost 15 of the 83 by-elections in the course of the parliament and made no gains. The local election results were also encouraging, with Labour regaining some of the ground it had lost in earlier years when its representation had been decimated, and it had lost control of strong holds such as Newcastle and Sheffield as well as the Greater London Council. In this favourable climate the Prime Minister decided to hold an early election. The date was set for 18 June—the first June election this century. The campaigns of the two parties were very different. Mr Wilson conducting his in an almost casual fashion and Mr Heath trying desperately to bestir the electorate from its illusions of what he called 'sham sunshine'. The only fireworks in the campaign were provided by Mr Powell when he wondered whether the statistics on immigration had been falsified deliberately and Mr Wedgwood Benn when he accused Mr Powell of hoisting over Wolverhampton the flag that was beginning to look suspiciously like the one that fluttered over Dachau and Belsen. On the eve of the poll a Labour victory seemed certain. The opinion polls with one exception (Opinion Research Centre) were predicting a Labour victory by margins varying from a 2 to a 9 per cent lead over the Conservatives. The eventual result was a 4.7 per cent swing to the Conservatives and their return to power with an overall majority of 30 over all other parties. The reasons for what appears to be a last minute change are complex but the most accepted argument is that the publication of unfavourable trade figures just 3 days before polling day enabled the Conservatives to stir up anxiety about the cost of living and the economy. On 19 June a smiling Mr Heath stood on the steps of 10 Downing Street and declared 'To govern is to serve. This government will be at the service of all the people the whole nation. Our purpose is not to divide but to unite and where there are differences to bring reconciliation to create one nation.'

A New Style of Government

The Heath team was a blend of the old and the new. The senior posts were taken by the older men notably Sir Alec Douglas Home at the Foreign Office, Reginald Maudling as Home Secretary, Iain Macleod as Chancellor of the Exchequer and Quintin Hogg who took back his old title of Lord Halsbury to become Lord Chancellor. The

new faces included Anthony Barber who was given special responsibility for negotiations with the Common Market countries, Sir Keith Joseph in charge of social security and Mrs Margaret Thatcher in charge of education. Due to the tragic early death of Iain Macleod, so long the party's economic expert and one of its best front bench debaters, a few short weeks after achieving his ambition of becoming Chancellor, changes had to be made. His place was taken by Anthony Barber and in the reshuffle that followed, John Davies entered the cabinet to take over the newly created empire of Trade and Industry, Geoffrey Rippon being shifted to responsibility for Europe. These changes seemed about the only activities the government were undertaking over the summer months and they ran into severe criticism for inactivity in the face of mounting inflation. There were some moves in foreign policy negotiations being opened for at least a partial restoration of the British presence East of Suez and exploratory talks on the restoration of arms supplies to South Africa. In October the Chancellor introduced a mini Budget curbing expenditure and promising a reduction in income tax as from April 1971. This seems to have done little to curb the round of wage increases and December saw a strike of the electricity workers following an earlier one in which the dustmen pitted against the government received most of what they were asking for. The electricity workers' claim was settled by a court of inquiry (Wilberforce) but at the time of writing (February 1971) the postal workers were out and the motor car industry was also having labour problems. We have yet to see the government's more short term solution to this turbulent problem but its long term policy is contained in the Industrial Relations Bill at present before parliament. This is being disputed by the Labour party and the trade union movement. In foreign affairs too the government is taking a line different from that of its predecessors. In particular the decision on the supply of arms to South Africa has caused an uproar and judging from the remarks of African leaders at the recent Commonwealth Prime Ministers Conference in Singapore, the future of the Commonwealth may be in danger. See also Part II under Central and Local Government and Section G Part IV under Internal Developments.

Northern Ireland

Northern Ireland went to the polls in June 1970 along with the rest of Britain to elect its 12 representatives at Westminster. The Ulster Unionists took 8 of the 12 seats with Antrim (North) going to the Rev Ian Paisley of the break-away Protestant Unionist party, Fermanagh and South Tyrone being captured by the Civil Rights leader Frank McManus, Miss Devlin holding on in Mid Ulster and Gerry Fitt consolidating his gain of 1966 in Belfast (West).

Unlike England where in alternations party system exists Northern Ireland has had a one party government for 50 years a major factor in the present situation See also C80(1)

The United Kingdom government sent troops to Northern Ireland in 1969 to curb the violence between the Roman Catholic and Protestant communities Both Labour and Conservative governments have declared that there will be no change in the constitutional relations between Northern Ireland and Great Britain without the consent of the parliament of Northern Ireland that attempts to impose political views by gun rule will be crushed, and that the British government stands as guarantor of Stormont's programme of reform to redress communal grievances

Although the underlying situation has improved and communal strife is less acute as the reforms agreed between Westminster and Stormont take effect terrorist activity has continued

Mr Brian Faulkner heads the new Stormont Cabinet following the resignation of Major Chichester Clark in March 1971

WESTERN EUROPE

France and de Gaulle

In 1958 General de Gaulle who had had a brief period of power in 1945-46 established a semi presidential system with himself as President taking certain powers away from Parliament and thus opening France's Fifth Republic next year The President's seven year term ended in December 1965 and although he had then reached the age of seventy five he submitted himself for re election and won with 55.2 per cent of the votes During his first term of office he steadily brought the war in Algeria to an end despite all the hopes reposed in him that he would suppress the independence movement This was a tremendously courageous achievement and what was equally courageous he brought France through the threat of civil war precipitated by those who were for continuing force upon Algeria The drive to economic recovery had it is true commenced before he came to power But on the political side he reasserted French spirit and struck out upon a lonely path building his nuclear force without receiving technical knowledge from America (as we had)

The Right to Participate in Decisions

Recovery having been accomplished by 1958 de Gaulle was determined that France should assume its historic rôle in world affairs She could therefore no longer assent to delegating to the U.S. exclusive authority to make the vital decisions for the defence of the free world everywhere in the world He wanted not only the right to participate but the official and public recognition of that right by the creation of a three power organisation to take joint decisions on global problems The United States declined Next year came de Gaulle's next step—the withdrawal of naval units from NATO's Mediterranean Command The following year 1959 de Gaulle announced that France would proceed to build an independent national atomic force In 1962 when Kennedy proposed Atlantic partnership with Europe de Gaulle replied with a plan to group the Western European nations into an organisation that would be one of the three powers of the planet In January 1963 de Gaulle rejected an offer by Kennedy to make American Polaris missiles available to them but to be assigned to a multilateral Atlantic force Macmillan accepted a similar offer at the Nassau Conference The division between de Gaulle and Macmillan was thereupon wide open At the beginning of 1963 the General slammed the door to the Common Market in Macmillan's face and refused to sign the atomic test ban treaty Exactly a year later de Gaulle recognised Communist China which must have angered the United States deeply In 1965 de Gaulle left SEATO the South east Asia Treaty Organisation and next year NATO was asked to remove its headquarters from France

A Crisis of Government May-June 1968

The student rising of May 1968 touched off a nationwide wave of unrest The most violent battles raged in the Latin Quarter between students and riot police An eye witness said it might have been in the days of the Commune Universities were occupied by militant students and factories by workers Mass strikes involving more than 2 million workers paralyzed the French economy for much of May and part of June

The immediate aim of the French students had been to force changes in the running of their universities and their grievances were very real But this discontent in the academic field overlapped with political and ideological discontents and gave expression to the dissatisfaction felt by thousands of young people whether at universities or not They are discontented with present day Western civilisation with paternalism and demand the right to question and dissent

Sweeping Gaullist Victory

On May 24 President de Gaulle announced his intention of holding a referendum asking the people for a mandate to reform the nation's economic social and educational institutions the reforms to include participation by workers in the running of the factories and by students in the running of the universities However after a visit to the French forces in Western Germany on May 29 (kept secret at the time) and a Cabinet meeting the next day the President dissolved the National Assembly and the referendum was dropped Instead a general election was held on May 31 and a new government under the premiership of M. Pompidou was formed There was a gradual return to work after demands for higher wages had been met and by mid June the student occupation of the universities had ended The revolutionary students organisations that had taken part in the revolution—anarchist Fronteysite Maoist Castroist and Daniel Cohn Bendit's Movement of March 22—were dissolved under a law of 1966 The elections resulted in a sweeping victory for the Gaullists The Federation of the Left and the Communist Party lost half their seats in the Assembly M. Mendes France was rejected by his parliamentary constituency of Grenoble A new Union of the Defence of the Republic was set up as the official Gaullist organisation

Resignation of de Gaulle

Early in 1969 de Gaulle decided to attack the French Senate Not by parliamentary means but by his favoured method of direct appeal to the electorate through a referendum he sought to take away what were left of its decision making powers leaving it with only consultative functions Under his proposals if the office of President of the Republic became vacant its functions would be exercised temporarily by the Prime Minister and not by the President of the Senate as laid down by the Constitution At the same time he sought to reorganise the country into regions The French people were asked to say Yes or No

No to these two major constitutional changes and de Gaulle made it clear that a defeat in the referendum would mean his resignation If the sweeping victory for de Gaulle in the 1963 election was due to the fear of civil war (as it was in 1958 and in 1961-62) in 1969 there was no threat of chaos and the referendum took place in a period of calm Contrary to most predictions the French people voted against the proposed reforms

Non won by 11 945 149 (53.15 per cent) to 10 512 469 (46.81 per cent) Paris and other large cities showed large Non majorities On the morning of 28 April 1969 de Gaulle issued a communiqué which read I am ceasing to exercise my functions as President of the Republic This decision takes effect from mid day today

De Gaulle's resignation led immediately to fresh presidential elections the main contenders being M. Pompidou (Gaullist) M. Poher (Centre and acting President) and M. Duclos (Communist)

M Pompidou was elected on the second ballot the Communists abstaining

Death of de Gaulle

General de Gaulle died on 11 November 1970 from a heart attack at his home at Colombey les Deux Eglises the village where he was buried at his own request with a minimum of ceremony. He was 79. De Gaulle was a leader of great courtesy and wit but he was always an isolated leader and his judgments were always impressive because of this detachment. His purely political gifts were of a high order for a man who entered politics at 50. However his mastery of words and his certainty that his was the right way led to contradictions which his enemies made capital of. De Gaulle's solid achievement is that the constitutional changes which he introduced remain. So does the party which he created to assist him in maintaining power. And while there have been changes (French hostility to Britain's joining the Common Market has been reversed) Gaullism remains a powerful political force.

Adenauer and Western Germany

A notable personal achievement of the last two decades was Dr Konrad Adenauer's Chancellorship of the West German Federal Republic for fourteen years until his retirement in October 1963 at the age of 86. He gave to a people who had not known democratic government for 15 years a new confidence and self respect. He committed himself to constitutional government despite the fact that he was a natural autocrat. Under him Germany enjoyed the first period of stable government since the First World War. As a consequence of this new confidence Germany rebuilt prosperity from decay. His work in building a special relationship with France culminating in a treaty of friendship was a dramatic contrast to the long tradition of enmity with France through which he had lived. But while he succeeded in building his country into the Western community he remained intransigent over East Germany and since a solution must be found it remained for a more imaginative successor to grapple with it.

Erhard and Kiesinger

In September 1966 when financial troubles were developing Dr Erhard Chancellor tried to amend the constitution so as to curb the financial powers of the Lander. For this he needed a two-thirds majority in the Bundestag which he could not secure. His place was taken by Dr Kurt Kiesinger. Germany's third post-war Chancellor who was able to take office only by the fact that the Social Democrats (SPD) agreed to join the Christian Democrats (CDU). Dr Erhard had become Chancellor in 1963 as the most popular politician in the country. He left when Germany's role in world affairs was undecided and its internal political future dangerously uncertain. Erhard was a determined opponent of hysterical nationalism and was a loyal supporter of the Atlantic Alliance—indeed it was held that he encouraged ties with the United States at the expense of the Franco-German friendship treaty which had not lived up to the hopes reposed in it. It was this factor which accounted for the enmity of the Bavarian wing of the Christian Democrats called the Christian Social Union (CSU), the party of Herr Strauss. The CSU put its weight behind Dr Kiesinger's nomination for the Federal Chancellorship and Herr Strauss was suitably rewarded with a Cabinet post.

The End of Christian Democratic Rule, 1969

The first break in CDU supremacy occurred in March 1969 when the Liberal Free Democrats (FDP) decided to back the SPD nominee for President Dr Heinemann who was elected by the Federal Assembly by 512 votes to 506. The second break came with the general election at the end of September when the SPD made significant gains in both votes and seats.

	1969		1965	
	Seats*	Votes percent age	Seats*	Votes percent age
CDU/CSU	242	46.1	245	47.6
SPD	224	42.7	202	39.3
FDP	30	5.8	49	9.5
NDP	—	4.3	—	2.0
Others	—	1.1	—	1.6

*Excluding West Berlin (non voting) representatives

Despite widespread publicity the extreme right wing NPD failed to qualify for any seats since it polled less than 5 per cent of the total votes. Thus the three party system remained. The third break occurred in October 1969 when the SPD and FDP leaders agreed to form a coalition government with Herr Brandt the SPD leader as Chancellor and Herr Scheel the FDP leader as Foreign Minister.

Efforts to Improve Relations Between the Two Germanies

During 1970 there were two meetings between Chancellor Brandt and the East German Prime Minister Herr Stoph. Herr Brandt's visit to the town of Erfurt in March was noteworthy when several thousand young East Germans massed in his support outside the conference hotel. However the significance of the meeting was that it took place at all rather than in anything it produced. The return meeting in Kassel in May showed that Herr Brandt had accepted the existence of two separate states within the German nation. However this fell short of East Germany's demand for complete recognition by Bonn. Six months of silence followed before talks were resumed this time at a lower level. The signs are that the Russians wish to consolidate the status quo in Eastern Europe while the Allies hope for positive improvement allowing West Berliners greater access to the East. A treaty signed by West Berlin and the Soviet Union in Moscow in May stated that borders of all European countries are inviolable including that between the Federal and the Democratic republics. Bonn implies that frontiers can still be changed by mutual agreement. But the treaty still awaits ratification and this depends on a satisfactory outcome of Four Power talks on Berlin.

Greece

Fearing the confidently expected victory at the elections of 28 May 1967 of the Centre Union dictatorial power was seized by the Right in the preceding month. Many politicians, journalists and others were arrested, no charges in many cases being preferred. A rigid press censorship was imposed. The 26 year old King was confronted with an immensely difficult task: the councils of the Right junta not wishing for his abdication although they would have pressed forward with their policy even if he had. The new régime was naturally susceptible to foreign opinion. But a very important key was held by the U.S. since Greece has been described as an American protectorate. But the Council of Europe gave the Greek government a warning. Four member countries complained that the new Greek régime had violated eight articles of the European Convention on Human Rights. The Council warned Greece that unless the government ceased to repudiate the values which the council exists to uphold Greece would be suspended or expelled.

The critical position of the King came to a head in December 1967 when after an abortive attempt to free himself of the military junta he went into exile at Rome.

In December 1969, Greece withdrew from the Council of Europe when it became clear that a majority of the 18 member states had decided to vote for her suspension. This followed a report

by the council which described the Greek régime as undemocratic, illiberal, authoritarian and repressive. There is still no real sign of a return to democracy and the régime of Mr Papadopoulos is still in control after four years. Mr Papadopoulos managed to get the supply of heavy arms from the United States resumed in 1970 without naming a date for elections. But elections as stipulated under the Greek constitution would be far from free: candidates would have to be approved and party programmes would have to be vetted by the constitutional court. Would politicians faced with these restrictions stand? Campbell Page the *Guardian's* specialist on Greek affairs argues (Feb 1971) that absenteeism never pays in Greek politics and only guarantees deeper obscurity. One possibility is the emergence of a party uniting all elements opposed to Mr Papadopoulos which would have the prospect of sizeable electoral victories. The stress of foreign pressure—the U.S. is likely to reappraise its diplomatic policy in Greece this year—and his growing unpopularity among Greeks have weakened the prime minister's position. The question of how long he will last is now a serious one.

EASTERN EUROPE

A Turning Point in Soviet History

In 1961 Khrushchev publicly and dramatically completed the process which he had begun in 1956 of drawing a line under the Stalin régime and finally rejecting the cult of Stalin. This change was symbolised by the removal of Stalin's body from the mausoleum at the Kremlin. At the same time Khrushchev was confronted by an external challenge to his leadership of the Communist world: by China who believed that Russia was moving steadily away from classical communist doctrine.

Stalin had made the Soviet Union a modern industrial society and a great armed power. But the arbitrary bureaucracy through which this had been achieved had in Khrushchev's view overrun itself. Radical changes became essential and Khrushchev attempted various steps—the scaling down of the secret police, the rebuilding of the administrative apparatus, the opening up of virgin lands and a new theory that war was not inevitable. The legacy of the Stalinist era had been the concept of the monolithic party that is to say a party which however torn by internal conflict must never allow any open division of opinion and free debate much less the formation of any groups expounding distinctive views. In the light of the trials of authors in 1966-7 the view was bound to be taken outside Russia that the process of deStalinisation had not gone quickly enough.

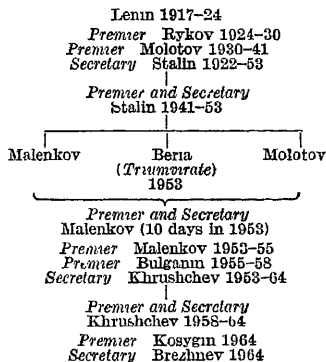

Khrushchev Leaves the Political Scene

The career of Nikita Khrushchev as Soviet Prime Minister and Leader of the Communist Party came to an end—to the surprise of the world—in October 1964. Stalin had died in 1953 and the struggle for succession then continued for five years when Khrushchev emerged with supreme authority. Upon Stalin's death a triumvirate of successors Malenkov, Molotov and Beria had decided to give the post of party chief—First Secretary—to Khrushchev, then a relatively harmless outsider, or so he was deemed by them. Beria, the all powerful police chief, was executed as a spy in 1953. Malenkov was forced to give up the premiership in 1954 and three years later both he and Molotov were expelled from the Central Committee. Khrushchev thereupon emerged with supreme powers and became the talkative and jocular leader whom the world knew

The Pattern of Change in Leadership

The student of affairs may be puzzled by the strains and dislocations which occur upon a change of leadership in Russia. But this is less surprising when it is remembered that there is no constitutional manner of embodying a change of

opinion or policy in an alternative party or group of men. It will be seen from the diagram of events that after Lenin's death control was divided between the Secretary of the Party and the Premier for seventeen years until Stalin combined both posts. After Stalin's death in 1953 control was again split (except for ten days) for another five years until in 1953 Khrushchev who had been Secretary for five years combined the two posts again until 1964. The pattern repeated itself in 1964, Kossygin becoming Premier and Brezhnev Secretary. A meeting of the Supreme Soviet in 1965 confirmed the principle of collective leadership. At the 23rd Soviet Party Congress held in April 1966 it was decided that the Presidium of the Central Committee should go back to being the Politburo and the First Secretary should revert to General Secretary. The 24th Party Congress held in April 1971 voted to enlarge the Politburo from 11 to 15 which will make retirements possible over the next year or two without any high level dismissals. The new Politburo in order of precedence is as follows: Brezhnev (General Secretary), Podgorny (President of the Soviet Union), Kossygin (Prime Minister), Suslov (the Party's theoretician), Kirilenko, Pospelov, Mazurov, Polyansky, Shelest, Voronov, Shelepin, Grishin, Kunayev, Shcherbitsky and Kulakov. Brezhnev, Suslov, Kirilenko and Kulakov by virtue of their joint membership of both Secretariat and the Politburo appear to form a powerful group within the Soviet leadership.

Russian Military Intervention in Czechoslovakia

In March 1968 when public pressures had secured the removal of President Novotny of Czechoslovakia it was thought that a genuinely democratic form of communism could be evolved in a communist country and that the Czech example would encourage other Communist countries to reform themselves. But the Soviet Union did not see the new liberalisation policy like that but rather as preparation for a counter revolution leading Czechoslovakia back to capitalism. In July Mr Brezhnev said that the Soviet Union could not be indifferent to the building of socialism in other socialist countries and referred to the Hungarian 1956 uprising. Leaders of the Warsaw Pact countries sent a letter to the Czechoslovak party saying that they were deeply disturbed by recent events in Czechoslovakia. The allegations were refuted by the Czechoslovak Presidium and Mr Dubcek broadcast to the nation reaffirming that we have no alternative but to complete the profound democratic and socialist changes in our life together with the people. Talks between the Czechoslovak Presidium and the Soviet Politburo opened at Cerna at the end of July 1968 and at the beginning of August another meeting was held at Bratislava. Afterwards Mr Dubcek, in a television broadcast said that the meetings had opened up new scope for the revival process in Czechoslovakia. Then without the knowledge of the President of the Republic Russian forces

with contingents from East Germany Poland Hungary and Bulgaria entered Czechoslovakia on the night 20-21 August. The Czech Presidium appealed to all citizens to maintain calm and not to put up resistance to the invading troops.

The Soviet Union justified the military intervention on the grounds that a departure from Marxism-Leninism by a communist country affects all others. This view has been challenged by those who argue that Marx and Lenin accepted the theory of different paths towards socialism.

The New Policy

Since the Soviet led invasion of August 1968 there has been a continuous growth of Russian influence over Czechoslovak national affairs particularly through the removal from office of the principal figures associated with the reform movement. In April 1969 Mr Dubcek was replaced as First Secretary of the Czechoslovak Communist Party by Dr Gustav Husak. At the same time Mr Smrkovsky lost his position as a member of the Presidium. Speaking at the World Communist Conference held in Moscow in June Dr Husak described the new policy of his country after January 1968 as seeking to effect a transition from bureaucratic centralism to a broader socialist democracy. But in the process the rôle of the Communist Party had been weakened and a situation arose in which naivety and romantic political ideas were prevalent as well as cheap gestures and non class slogans about freedom democracy humanitarianism and the will of the people.

During 1970 the party purge continued with the expulsion of Mr Dubcek former party leader and by September roughly one fifth of party members had either resigned or been expelled. Yet unlike Hungary in 1956 the revisionists did not put former leaders on trial in spite of pressure on Dr Husak from party hard liners.

World Communist Conference 1969

After more than a year's preparation the first international conference of Communist parties since 1960 met in Moscow in June 1969. It was attended by delegates from 75 parties. Among the countries not represented were China North Vietnam North Korea Yugoslavia and Albania. The Cuban and Swedish delegates attended as observers only. The final document made no direct reference to Soviet criticisms of China nor to the invasion of Czechoslovakia although these issues were no doubt in the minds of many delegates. The conference dealt with the problem of how to reconcile the principle of sovereign independence with the principle of proletarian internationalism and mutual solidarity. Signor Enrico Berlinguer for the Italian Communist party emphasised the importance of ending the disagreement with China. Account must be taken of the economic realities of Chinese society and China's rôle in the world. The policy of peaceful co-existence and the anti imperialist struggle need China's positive contribution. China obviously carries great weight in the international situation. That is why we think it necessary to make an effort to understand the changes taking place in China. Signor Berlinguer went on to say that it is necessary to thrash out all problems frankly and freely and to recognise and fully respect each party's independence in its search for its own way to socialism. The most striking feature of the document was the assertion that there is no leading centre of the Communist movement in contrast to the statement issued by the 1960 Moscow conference that the Soviet party was the universally recognised vanguard of the world Communist movement. At the same time it asserted that the defence of socialism is the international duty of Communists.

Sino-Soviet Relations

During 1970 there was some improvement in Sino Soviet relations. There was an exchange of ambassadors between Moscow and Peking and in the autumn a new trade pact was signed.

THE MIDDLE EAST

Nasser and the New Egypt

A new factor in the Middle East was introduced when the Egyptian Army revolted in 1952 overthrowing the monarchy leading two years later to the emergence of Nasser as Prime Minister. In that year Nasser secured the agreement where by all British forces were to leave the Suez Canal Zone by 1956. Egypt did not become a democracy in any Western sense but the government runs all the basic enterprises of the country. In 1956 Nasser internationalised the Suez Canal Company as a reply to the withdrawal by the United States of its offer to finance the High Dam at Aswan. The attack by the British and French on Egypt followed causing serious disagreement with the United States which inspired international action to rescue Egypt. It was in obedience to a demand by the UN Assembly that Britain France and Israel withdrew from the attack on Egypt and an international force of about 6 000 men was organised to help avert further conflict. When in April 1957 the canal was cleared and in use Egypt not only insisted on full control of the canal but on the right to bar Israeli trade from the canal. Egypt and Saudi Arabia said they would resume blockading the Gulf of Aqaba (a N.E. arm of the Red Sea) but in fact Israeli ships subsequently got through to their previously blockaded port of Eilat. A small UN force remained on the Gaza-Eilat armistice line.

The closure of the canal in the summer of 1967 cost Britain's balance of payments about £20 million a month since oil had to be brought more expensively from non Middle East areas. The growth of big tankers said Mr Wilson may very soon make the Suez Canal a rather pathetic irrelevance. But all the same he declared it as intolerable that any nation should keep the canal closed to international shipping.

The Middle East War of 1967

The third Arab-Israeli war began on 5 June 1967. In the words of *The Times* What began as the usual spring exercises of the Syrian army shelling Israeli settlements in Galilee ended with the complete overthrow of the Middle Eastern balance of power. Israel destroyed the air forces of Egypt Jordan and Syria in a few hours destroyed their three armies in six days occupying all Sinai to the banks of the Suez Canal (which was therefore closed) the west bank of the Jordan and the Syrian hills above Galilee. The war was a disaster for Britain who with America was blamed for a catastrophe which in the view of *The Times* the Arabs had brought on their own heads. Among other results the Russians moved permanently into the Middle East backing the Arabs. The toll of human misery was and remains too immense to imagine at least 300 000 new and old refugees fleeing the occupied territories. And despite the cost of this human and material loss and distress the problem of Israeli-Arab hostility remains unresolved.

UN Appoints Envoy to the Middle East

Thanks to the efforts of Lord Caradon who was then British Ambassador to the UN the members of the Security Council in November 1967 reached agreement and unanimously to send a special emissary to the Middle East. Mr Gunnar Jarring a Swedish diplomat whose mastery of twelve languages includes Arabic. An active Arab scholar he was not known to have sympathies one way or the other in the Middle East. Nasser criticised the Security Council's resolution to send Jarring as inadequate and Syria rejected it. Nasser repeated the formula he had declared at the Arab summit conference in September of no peace no recognition and no negotiations. The chief obstacle faced by the UN mediator was the mistrust by each side of the other's motives and ultimate intentions.

The Israeli case remains that peace can only be achieved through a negotiated settlement between

the parties directly affected which involves recognition of Israel as a nation state. Further more since neither the UN nor the four Powers can of themselves guarantee a settlement Israel in the interim period must rely on her own resources to maintain her existence. The Arab governments have continued to insist that Israel must first withdraw from the occupied areas before a settlement can be considered and even before recognition can be accepted. The Palestinian *Jedayeen* organisations of which *Al Fatah* is the principal body go further and refuse to accept the state of Israel at all.

The Spread of Violence

The fighting continued in 1970 until the U.S. produced a peace initiative which led to a cease fire between Egypt, Jordan and Israel from 7 August. On 28 September the Arabs and Egypt lost their leader President Nasser who died of a heart attack. Nasser was the first Arab leader to respond favourably to any Middle East peace proposal from the West. The U.S. offer was for a three month cease fire along the Suez Canal and mediation through Dr Jarring, on the implementation of UN resolution 242 which calls for Israeli withdrawal. Israel accepted this plan after long consultations with Washington so did Jordan and Lebanon. But peace hopes were shattered when Israel withdrew from the talks after accusing Egypt and the Soviet Union of moving missiles into the standstill zone. The charge was denied by Egypt and both sides agreed to a further three months extension with President Sadat (Nasser's successor) warning that Israel must produce a timetable for withdrawal from the occupied territories.

Palestinian guerrillas have been predictably hostile to the proposals which they feared would frustrate their plan to establish a democratic state of Palestine in place of Israel. This exacerbated the conflict between the guerrillas and King Hussein's army, the guerrillas having used Jordan as the base for attacks on Israel. Jordan has consistently borne the brunt of Israeli retaliation. The Popular Front for the Liberation of Palestine (PFLP), a small well organised *Jedayeen* organisation attempted to break the cease fire and usurp King Hussein's rule and wrest leadership of the guerrilla movement from *Al Fatah* by hijacking 400 people in three aircraft to a disused airfield in northern Jordan. This was in September 1970. Most passengers were released but 45 Europeans were held hostage after the aircraft had been blown up. After ten days of fighting in which there were up to 10,000 casualties, President Nasser prevailed on King Hussein and Yasser Arafat, leader of *Al Fatah* to sign a peace agreement. The President died the next day.

Subsequently the smaller guerrilla groups dwindled and *Al Fatah* has emerged as a moderate movement. The most hopeful sign in 1971 comes from President Sadat who indicated for the first time that Egypt would be prepared to sign a contractual peace treaty with Israel guaranteeing her inviolability and independence within secure and recognised boundaries. He also said that Egypt would recognise Israel's freedom of navigation in the Suez Canal. Israel's reply at the time of writing (March 1971) while likely to include a rejection of a retreat to the borders before the Six Day war may include the first tentative offer of a map redrawing. Observers agree that Mrs Meir may agree to cede that part of the Sinai peninsula west of a line from El Arish to Sharm el Sheikh.

ASIA

The independence and unity of India on the one hand and the emergence in China of the Central People's Republic on the other form with the Vietnam war the three important political features of Asia. India and China have lived historically speaking in different worlds their experiences at the hands of the West have been different, their recent developments and their present political systems are entirely dissimilar—the one a democracy and the other authoritarian.

Indian Changes under British Rule

The pattern of India's development after independence had been set during British rule. The main features were the concept of law and the rule of law, a civil service superior to any known before in Asia, a system of education introduced as far back as 1855, English as a common language and the growth of an intelligentsia (to use a word with a Russian origin) with a humanistic outlook and responsive to Western ideals and traditions. Important consequences followed from these changes. They enabled Hindu society to reform itself on the basis of modern ideas to create an educated leadership to modernise Indian languages and to introduce modern science to India.

Leadership Since Independence

That the dissolution of British rule was made so peacefully, a miracle of modern times was due principally to Gandhi who associated nationalism with ethical concepts summed up in the term Gandhism, and denoting pacifism, the value of the individual soul and humane ideas. He made India conscious of the social reforms which needed to be made and created the discipline to make a democracy able to carry them through. Gandhi's ideal of religious unity though disrupted by the partition into the two states, Pakistan and India, made it possible for the new India to be a secular state in which all religious and minorities had equal rights.

Nehru, India's first prime minister symbolised India's highest aspirations. As a disciple of Gandhi he revered him but his political outlook had been different. He was an enlightened liberal working towards a modernised rational democratic secular state enjoying both the benefits of large scale scientific organisation and the spiritual good of individual liberty. Under great strains this way and that he maintained neutrality in the face of world power blocs and embodied in his politics characteristics from differing régimes. He overpowered everybody in Indian public life and was one of the few great figures on the world stage.

Shastri succeeded Nehru. Lal Bahadur was born in 1903 into a caste lower than the Brahmins but equally dedicated to learning. Shastri's air of gentleness was enhanced by his small size and even by his adversaries in India he was regarded as a good kind and tolerant man. He faced problems as complex as any statesman in the world's biggest hungriest and restless democracy. One of his biggest decisions was not to follow China in the nuclear weapons race.

Mrs Indira Gandhi became Prime Minister of India in January 1966 upon Mr Shastri's death at the Tashkent conference. Her father was Nehru and she must be regarded as the only daughter in history to have succeeded her father. She is not a relation of Mahatma Gandhi. In Indian families women have always been very highly regarded and India is one of the very few countries where nothing stands in the way of a woman going to the very top. Mahatma Gandhi so far back as 1929 had been uncompromising on women's rights and after Indian independence Hindu law was changed to satisfy his requirements on the status of women. Thus it was Gandhi who took women into politics and paved the way for the election in 1966 of Mrs Gandhi, the world's most powerful woman (Mrs Bandaranaike of Ceylon holds the distinction of being the first woman Prime Minister in history). Mrs Gandhi is more radical than both her father Nehru and Mr Shastri but clings to no ism and will confront each problem individually. Among those round Shastri who helped to guide India, she was by far the most cosmopolitan. Educated in Switzerland and at Oxford she travelled widely with her father and as his hostess met many world leaders. Her family is Hindu and there is no doubt that she shares her father's devotion to the ideal of a secular state. She faced on election many difficulties she promised to honour the agreement with Pakistan reached only a few days earlier at Tashkent where Mr Shastri died and she announced her willingness to negotiate with China if favourable conditions are created.

The Indian Elections 1967

The monopoly of power enjoyed by the Congress Party of Gandhi and Nehru over India for twenty years was dramatically broken in March 1967. Between 60 and 70 per cent of the Indian electorate of 240 million used their vote. Half Mrs Indira Gandhi's Congress Cabinet lost their seats as well as three of the most powerful Congress Party leaders. Several State Governments were overturned. The result represented therefore an emphatic protest vote against continued Congress rule rather than a positive choice of a clear alternative vote. The protest vote went to whichever party seemed locally most capable of turning Congress out. The Congress Party was left with a very thin majority but it remained the largest single party in the country.

A Congress Deeply Divided

Differences on economic policies within the Congress Party came to a head in July 1969 when Mrs Gandhi chose to revive the issue of bank nationalisation in sharp form. Two years earlier in July 1967 the leadership divided on outright nationalisation settled on a compromise formula and introduced social controls on both banking and insurance. On 20 July Mrs Gandhi nationalised the country's 14 large banks by ordinance relieved Mr Desai of the finance portfolio as he differed with her on economic policy and swiftly piloted the bill through Parliament. In her broadcast to the nation she said that the nationalisation of the banks would herald in a new era in carrying out the Party's policies. She emphasised that this did not mean an era of nationalisation. Mrs Gandhi's action was supported by Congress radicals, communists and socialists and by the people at large. Big business and the two right wing parties the Swatantra Party and the Jan Sangh condemned it as a treacherous act against the constitution. In an unexpected judgment the Supreme Court of India in February 1970 restored the 14 nationalised banks to their original owners. The court found that the Government had excluded foreign and minor banks from the scope of the Act passed in 1969 and said that this amounted to discrimination under the constitution. Two courses seemed open to Mrs Gandhi: to amend the constitution for which she would need a two-thirds majority or to enact new legislation to comply with the Supreme Court's objections.

The fiercely fought Presidential election in August 1969 marked a further stage in the conflict between the Prime Minister and her opponents. Mr V. V. Giri the Acting President defeated Mr N. S. Reddy the nominee of the syndicate — an inner group of party leaders consisting of older and more conservative elements in the Congress party. The intention of the Indian constitution was to make the President a figurehead but events are working to make him more powerful. Mr Giri who was 75 at the time is a distinguished trade union leader.

A New Direction

Indian democracy survived the split in Congress during 1970, the year of Mrs Gandhi's supremacy. In spite of leading a minority government she received larger votes of confidence from parliament than she did when Congress was united. This surge of confidence led her to call elections in March 1971.

An alliance of four main opposition parties formed to prevent vote splitting with the slogan 'Onst Indira'. Its components were Jan Sangh (Hindu Nationalist), the Opposing Congress, SSP (Socialist) and the Swatantra (Free Enterprise).

There was no doubt that Mrs Gandhi would win the election but the margin was expected to be narrow. In the event she achieved a landslide victory which more than made up for the losses sustained by the Congress Party in the 1967 elections before it split into two factions in 1969. Of an electorate of 280 million more than 100 million went to the polls. Mrs Gandhi called her victory a mandate for socialism. When opening the first

session of the new Indian Parliament President Giri said the government would immediately launch schemes for the vigorous implementation of the land reform laws and abolish the privy purses and privileges of former rulers through constitutional measures. Radical plans were outlined to combat unemployment and to increase production in public and private sectors. A mid-term reappraisal of the present five year plan would be made.

Pakistan

Pakistan's economy is still based largely on agriculture the principal food crops being rice and wheat and the main cash crops being jute, cotton and tea. Industry—including cotton and jute textiles, cement, fertilisers and oil and natural gas production—has been developing fairly rapidly and employment in manufacturing and other non-agricultural occupations is rising. Economic development has experienced a number of setbacks in recent years. In 1965 the outbreak of hostilities with India led to a sharp increase in defence expenditure and an interruption in the flow of foreign aid thus drastically reducing for a time the funds available for economic investment. Immediately afterwards the country was faced with two successive seasons of drought and flood with consequent harvest shortfalls so that scarce foreign exchange had to be used for increased imports of food. The political unrest which led to President Ayub Khan's resignation and his replacement by President Yahya Khan placed the economy under further strain.

A major political crisis had developed in November 1968 following the arrest of Mr Bhutto (former Foreign Minister and leader of the left wing Peoples Party) and student demands for educational reforms. On 3 February 1969 the Opposition parties rejected President Ayub Khan's offer of talks on constitutional reform unless he first ended the state of emergency (in being since September 1965) and released all political prisoners. Faced with mounting agitation throughout the country Ayub Khan decided to negotiate with the Opposition and from then on swift steps have been taken to restore parliamentary democracy in Pakistan. We give the sequence of events.

1969

February 17. State of emergency revoked by presidential proclamation.

February 21. President Ayub Khan announced that he would not be a candidate in the next presidential election.

February 26. Opening session in Rawalpindi of talks between President Ayub Khan and the leaders of the main Opposition parties.

March 13. President Ayub Khan agreed to introduce legislation to restore parliamentary government and universal adult suffrage.

March 25. Ayub Khan announced his resignation from the presidency and handed over administration to General Yahya Khan, C in C of the Army who proclaimed martial law, abrogated the constitution, dissolved the National Assembly and removed governors and ministers from office.

March 31. General Yahya Khan assumed the presidency saying he would act as Head of State until a new constitution had been framed by the elected representatives of the people.

November 28. President Yahya Khan announced that elections would be held on 5 October 1970.

1970

In March President Yahya Khan announced a new provincial system for Pakistan which freed the political parties and absorbed the country in a long and violent election campaign. A new 5 year plan was also announced to stimulate economic recovery. And the year saw also the worst floods of the century in East Pakistan. The

fourth 5 year plan was launched on July 1 promising an outlay of 70 500 million rupees with a growth target of 7.5 per cent for East Pakistan and 5.5 per cent for the West. But this scheme quickly suffered a blow when the Aid to Pakistan consortium meeting in Paris postponed a request for 500 million dollars making it dependent on progress towards democracy. In spite of this cold shoulder from the U.S. France and Britain Yahya Khan was able to secure substantial promises of interest free loans and plant from China and the Soviet Union.

President Khan's return from Peking coincided with the floods which killed at least 200 000 in the Ganges delta area in East Pakistan. The disaster postponed to December the first national elections in the country's 23 years of independence. The result of the election (electorate 56 million 26 parties fielded candidates) was not the expected multiplicity of factions which would have allowed Yahya to continue to rule. Two clear leaders emerged. In East Pakistan Shaikh Mujibur Rahman of the Awami League had a clear majority while Mr Bhutto of the People's Party triumphed in the West. However disagreement on the status of the National Assembly led the President to postpone its first meeting in March 1971.

Bangladesh (Bengal Nation) was the name chosen by Shaikh Mujibur Rahman for an independent East Pakistan but in April 1971 President Khan sent West Pakistan Air units to crush the independence movement. The result was carnage.

China

It is only in the last fifty years that the people of China have emerged from centuries of exploitation. It is very difficult for a Western observer to appreciate the dramatic changes which followed the overthrow of the repressive dynasty in 1911 and the advent of the Republic next year. The new leader Sun Yat Sen a great idealist and humanitarian pitted himself against the age long combination of landlords military men and reactionary scholars. For all his achievements Sun failed or rather Sun's party the Kuomintang failed him. Power passed to the military remnants of the old Imperial army and Sun did not succeed in giving his party teeth for militant action for reform. Unfortunately two years after Sun's death in 1925 his successor General Chiang Kai shek opened an anti Communist drive.

Sun's exhortations had been taken to heart by a poet and a scholar Mao Tse tung son of a yao man farmer from Hunan in the heart of China. Mao's success in raising peasant armies established his pre-eminence as a leader. The countryside helped the Communists to develop honest government. The peasants were ready to work in field and forge. They created a people's army superior to all other armies in Chinese history.

Mao Tse-tung and Other Leaders

Mao's reputation is based upon his ability first as a military theorist (of guerrilla warfare) second as a political philosopher (adapting Marxism to Chinese needs) and third as a more urgent champion of world revolution than the Russian leaders. Chou En lai the premier of the State Council is the best known of Chinese leaders in the outside world and also knows the outside world better than his colleagues. Until the recent upheavals Mr Liu Shao chi was Mao's right hand man and his heir apparent. But now the Defence Minister Marshal Lin Biao or Vice chairman Lin as he is called is Mao's chosen successor. This was formally stated in the new constitution that came before the Ninth Party Congress in 1969. His devotion to Maoism is beyond doubt. Mr Tung P'ei Wu was appointed President in place of Mr Liu Shao chi.

China's Cultural Revolution

What were the features of China's cultural revolution as it was called, of which so much was heard in 1966 and 1967? We first briefly indicate the main elements. (1) it was an organised demonstration of the young. (2) it was in favour of Mao Tse tung. (3) it disseminated Mao's essential

teaching. (4) it was intended to keep alive revolutionary fervour. (5) it thus engendered a sense of China's special path of development. and (6) it emphasised opposition to revisionism leading to bourgeois decay as it was said had occurred in Russia. When Mao himself in December 1968 gave the first hint of a coming purge he styled it a cultural revolution against bourgeois and revisionist elements. Let us amplify the main elements in the movement.

The organisation was directed to the under 20s who joined in mammoth demonstrations. Slogans and portraits of Mao Tse tung appeared everywhere. Huge crowds of young people with red armbands thronged the streets in general excitement. Red Guards took a prominent part. This tremendous emotional support for P'ei Liu Mao gave that leader (then 73) the assurance that his choice of successor would be accepted with confidence. Mao's essential teaching was disseminated by millions of copies of a little 300 page book of his selected writings in a red plastic cover carried by almost everyone and universally quoted discussed and preached. An objective of the movement was to stimulate the young who might otherwise take for granted the achievements of their elders made possible only by their past suffering and hunger. The revolution must be uninterrupted the class struggle continued. This revolution was not a special path being opposed to the super Japan western type technological society. At the same time the cultural revolution emphasised opposition to bourgeois attitudes and encouragement of revolutionary fervour. Beyond all this the young were urged to show initiative to make suggestions for improvements not to be afraid to criticise. The upheaval was described as a militant and not a militarist movement the weapons being the tongue the pen and the brush justified. It was argued the description of the revolution as a cultural one. But it developed into violent struggles between revolutionaries and reactionaries and then between the revolutionaries themselves. Mr Chou En lai warned that industrial production was being seriously affected. The situation remained very confused until 1968 when there was a gradual return to moderation. Of the 17 surviving members of the Politburo elected at the eighth Communist Party congress of 1956 13 were declared bourgeois reactionaries during the cultural revolution. President Liu Shao chi was among those expelled from the party. That era of turmoil is now over and Mao in order to fulfil his dream of a powerful industrialised China has united the country once again.

Ninth Party Congress

The ninth congress of the Chinese Communist Party the first held since 1958 took place in Peking during April 1969. It was held in conditions of great secrecy and was attended by over 1 500 delegates. One remembers writing a year ago wrote Mr Richard Harris in *The Times* of 17 September 1969 that all would be clear when the dilatory Chinese leaders finally got down to their ninth party congress. Well if the ninth congress revealed anything to the delegates it was certainly not passed on to the outside world. Unlike the eighth party congress which published in due course all the reports and the main speeches the ninth released only Lin Piao's largely retrospective report and a flaccid communiqué.

Sino Soviet Border Incidents

Serious clashes took place in March 1969 between Chinese and Russian troops on the Ussuri river boundary for control of the river islands. The region was once Chinese ceded to Russia in 1858. From this far eastern extremity the frontier with the Soviet Union runs for 4 000 miles (almost 7 000 miles if one includes Mongolia) to the great mountain chains of the Pamirs. China has wanted to renegotiate her borders ever since 1949 and amicable boundary settlements have been made with Afghanistan Burma Pakistan Nepal and Outer Mongolia. China entered into negotiations with the Soviet Union in 1964 being willing to take the Treaties of 1858 and 1860 as the basis for a settlement but without success.

Steps in the Conflict**1969**

March 2 First of a series of clashes over Daman sky (oi Chen Pao) Island on Ussuri river

March 29 Soviet Note invited China to resume frontier negotiations broken off in 1964

May 2 Clashes in Sinkiang border area

May 11 China accepted Russian proposal to resume regular meetings of Sino Soviet commission for navigation on border rivers. The commission was convened at Khabarovsk on 18 June

May 24 China maintained that negotiations should be held for the overall settlement of the Sino Soviet boundary question and the conclusion of a new equal treaty to replace the old unequal one

August 9 Sino Soviet agreement on border river navigation announced

September 13 Soviet troops reported to have crossed frontier into Sinkiang and inflicted casualties. Soviet Union and China exchanged protest Notes

September 30 Peking radio said China was ready to settle the border dispute with the Soviet Union by negotiations

1970

There were no major border incidents during the year. Some observers detected a faint mellowing in the relations between the two countries as evidenced by the exchange of ambassadors by Moscow and Peking. It is difficult to chart any firm progress in the talks which have been going on intermittently to settle ideological differences

A Break in the Clouds

There were signs in the spring of 1971 of improving relations between China and the West. At a reception in Peking on 14 April for visiting ping pong teams from the United States, Canada, Britain, Colombia and Nigeria the Chinese Prime Minister Chou En lai spoke of a new page in the history of relations between their peoples and the Chinese people. On the same day U Thant, UN Secretary General suggested that the time had come for a conference of the major Powers with China playing her full part. President Nixon issued a five point plan for the resumption of contact between the U.S. and China embracing new links in trade and travel with the removal of many restrictions and telephone services between London and Shanghai were reopened after a lapse of 22 years

China Tests Nuclear Missiles

In October 1966 without giving details of the weapon China announced she had tested a guided missile with a nuclear warhead thus conforming roughly to the timetable for the development of her missile nuclear capability anticipated by U.S. Intelligence studies. The Chinese announcement reiterated the assurance that China would never be the first to use nuclear weapons. China exploded her eighth nuclear device in December 1968 and in September 1969 carried out her first underground nuclear test and exploded a new hydrogen bomb. In April 1970 China launched her first satellite (singing the song 'East is Red') into orbit a development which reinforces the argument that China should be brought into arms control discussions

Vietnam

In 1941 the Vichy Government in France gave Japan who was our fighting enemy in the Second World War permission to use French Indo China as a base against us. Resistance groups were formed to win back independence and to overthrow both French and Japanese fascists. Japan collapsed in 1945 when the only organised troops were controlled by Ho Chi minh a Communist

who set up a Democratic Republic in the northern part of Vietnam. France was bent upon restoring her colonial empire in the south and next year war broke out between the French and Ho Chi minh. Readers will remember the dramatic siege and capture by Ho's forces of the fort of Dien Bien Phu in 1954. As a result of a 14 nation conference on Indo China at Geneva in the same year Vietnam was partitioned after a cease fire the country to be united after free elections. Laos and Cambodia became independent.

A declaration taking note of the agreement was signed by the following nations who took part: U.K., France, China, Russia, Cambodia, Laos and North Vietnam. Unfortunately the United States refused to sign the agreement and South Vietnam refused to hold elections but both affirmed that they would not use force to upset the agreement. There was thus a crystallisation into two Vietnams—Ho Chi minh's Hanoi régime in the North and that of the Catholic nationalist Ngo Dinh Diem at Saigon in the South. The Diem régime was corrupt but John Foster Dulles sent in men and materials to prop it up. By 1960 the Communist guerrillas in the South known as the Vietcong had set up a National Liberation Front. For eight or nine years a civil war was waged in South Vietnam against a very unpopular dictatorship. All that time it received United States military support and phrases like 'the defence of freedom in Vietnam are to be construed in the light of that fact. It is true of course that the North had been helping the rebels in the South. The position became increasingly untenable and in 1963 the Buddhists rioted against the ruling Roman Catholic minority. The Diem régime which had savagely persecuted the Buddhists was overthrown by the military the first of a number of military coups. In August 1964 two vessels of the U.S. fleet were alleged to have been attacked in the Gulf of Tonkin (off the North Vietnam coast) and American planes bombed North Vietnam installations as retaliation. This was the first of a series of bombing raids. At first the U.S. Government said that these were in fact raids but this specific basis was superseded by unrelated attacks. In March 1965 the American Ambassador in South Vietnam said that pressure against Hanoi would continue until the enemy gives in. In June 1965 the State Department gave authority to the American military commander to use troops in offensive operations against the Vietcong. An inquiry conducted by the U.S. Senate Foreign Relations Committee in 1968 made it doubtful whether the alleged attacks on the two U.S. destroyers in the Gulf of Tonkin had ever taken place. This put a question mark against the constitutional legality of the war as Congress had never declared war on North Vietnam.

There have been many attempts to bring about peace negotiations. In December 1967 N. Vietnam said peace talks would follow if the U.S. stopped their bombing unconditionally. In January 1968 President Johnson reaffirmed his San Antonio speech of September 1967 to halt bombing of N. Vietnam on condition that peace talks would follow and no military advantage would be taken of the pause. The San Antonio formula was dismissed by N. Vietnam as being a delaying tactic. N. Vietnam again stressed the necessity for the withdrawal of U.S. forces and said peace talks would begin as soon as the U.S. has proved that it has really stopped unconditionally the bombings and all other acts of war against N. Vietnam. Meanwhile the Tet (lunar new year) Vietcong offensive developed into a major campaign covering practically the whole of S. Vietnam.

Mr Robert McNamara left as Defence Secretary in 1968. He had become a counsellor of coolness and restraint. He rationed General Westmoreland in the supply of troops and he opposed some escalations which happened like the bombing of Hanoi and Haiphong. General Westmoreland who took over as field commander in Vietnam in 1964, was recalled to Washington in March 1968 to become U.S. Army Chief of Staff at the Pentagon. A major review of the Vietnam situation took place in Washington made necessary by the military political and psychological impact of the Vietcong Tet offensive. After being advised by his officials that a military solution was impossible

WORLD EVENTS

C17

PUBLIC AFFAIRS

and that the only possible political solution was a negotiated settlement. President Johnson in March 1968 announced his partial bombing pause. Peace talks began in Paris in May and by January 1969 the U.S., S. Vietnam, N. Vietnam and the National Liberation Front (NLF) were sitting round a table but because of fundamental differences between the two sides little progress has been made.

A Sketch of Ho Chi Minh.

Relatively little has been written about Ho Chi Minh who died on 3 September 1969 at the age of 79 and this is remarkable of a man whose country has figured so dramatically and tragically in post-war history. Let us therefore take a brief look at him first by recalling some of the external facts about him and second by a word of interpretation of his achievements and efforts. He had been President of Vietnam since 1945 and this innings must be in the running for a world record. In 1911 as a young man of 21 he went abroad and for thirty years remained an exile from his native land. In France, in England and elsewhere he studied the world wide struggle against colonialism and saw the problem he was particularly interested in—the oppression in Vietnam—as part of the widespread colonial exploitation. Thus the Russian Revolution must have made a great impression upon him illustrating that great changes were possible. Though for this reason he was sympathetic to communism his first concern was the anti colonial revolution in Vietnam. His main purpose therefore from 1945 was to weld together the two elements in Vietnam of nationalism and communism. By unusual powers of organisation he was successful in this. The evidence is that he did make a genuine and protracted attempt to negotiate independence with the French in 1946–48 and was prepared to make many concessions. The determination of the French to retain control of Indo China after the Second World War must be regarded as one of the most tragic mistakes of the period. The special character of his achievement is the dove-tailing of the national and communist elements in Vietnam and the balance between the two has been skilfully maintained however uneasy it may seem. Flowing from this was Ho's refusal to take sides in the Sino-Soviet conflict. His attempt to bind together nationalistic and communist elements has been the more remarkable when it is seen that Vietnam is the only country in South-east Asia where this has been possible. The Communists having been checked in Malaya in Burma in Cambodia and in the Philippines.

Steps in Vietnam History

- 1940 Japanese invasion France withdrew
- 1942–5 Vietnamese engage in guerrilla war on invaders Nationalists and Communists joining forces
- 1945 Japan withdrew and Nationalists declare Vietnam independent
Potsdam agreement makes Britain and China responsible for administration of Vietnam
- 1946 Britain invites French to help and then withdraws leaving French in charge
Terrorist attacks on French who made massive reprisals against civilians
- 1949 French install Bao Dai as national leader
- 1954 French defeated at Dien Bien Phu by the Viet Minh Geneva Agreements
- 1955 Bao Dai persuaded by U.S. to replace his prime minister by Ngo Dinh Diem (American educated Catholic) who in 1956 refutes Geneva Agreements and refuses elections
- 1960–3 Three years of increasing conflict between Diem and the National Liberation Front formed to oppose the Diem régime
- 1963 Neutral Buddhists appeal to Government for elections Diem attacks Buddhists Diem assassinated

- 1964 August 2 Gulf of Tonkin incident Prompted Congress to give Pres. Johnson authority to step up American military intervention in S.E. Asia
- 1965 February Large scale air raids on N. Vietnam opened
- 1966 January Major military operations by U.S. in the south
March 18 Hanoi bombed for the first time
- 1967 February Bombing of N. Vietnam increased
May Fighting in the demilitarised zone running between N. and S. Vietnam
August Bombing near Chinese Border
- 1968 January February Tet offensive coordinated Vietcong attacks on cities in S. Vietnam including Saigon
March 31 Pres. Johnson announced partial bombing pause
May Beginning of peace talks in Paris between U.S. and N. Vietnam
- 1969 January 25 Full scale peace talks open (U.S., S. Vietnam, N. Vietnam, NLF)
July 14 First major contingent of U.S. troops began withdrawal from S. Vietnam
September 3 Death of Ho Chi Minh
September 16 President Nixon announced withdrawal by mid December of further 35 000 troops
September 23 Mr. Ton Duc Thang elected President of North Vietnam
December 15 President Nixon announced withdrawal of 50 000 more American troops before 15 April 1970
- 1970 March 18 Prince Sihanouk Cambodian head of state overthrown in right wing coup
April 30 U.S. combat troops invaded Cambodia
June 29 Last rearguard U.S. units withdrawn from Cambodia one day ahead of President Nixon's deadline
- 1971 February 8 5 000 S. Vietnamese troops supported by U.S. helicopters and fighter bombers—but not ground forces—invasion Laos to cut the Ho Chi Minh Trail
February 25 S. Vietnamese drive in Laos halted
April American withdrawal from S. Vietnam well advanced

Basic Facts about Vietnam

The population is 32 million (N 15.5 S 16.5). Racially they are cousins of the Chinese and their culture is largely derived from China. Nevertheless they are ancient enemies of the Chinese. They are Confucians in their social attitudes. The main religion is Buddhism 70–80 per cent. Roman Catholic 7 per cent. The land area is 129 000 square miles (N 68 000 S 66 000). The leading figures in North Vietnam are Ton Duc Thang who succeeded Ho Chi Minh as President, Pham Van Dong the Prime Minister, Le Duan First Secretary of the Party, Truong Chinh the Party ideologist and General Giap the Defence Minister. The Government of S. Vietnam had been formed by military coup and as result of a limited election in 1967 the President is Lt. General Nguyen Van Thieu and the Vice President Air Vice Marshal Nguyen Cao Ky.

AFRICA

The Civil War in Nigeria

The civil war began in July 1967 after the secession of the Eastern Region under its Ib leader Colonel Ojukwu. This region became known as

Biafra. Federal troops under the head of the Federal Military Government General Gowon advanced into Biafra and cut the secessionists off from the sea and confined them to the Ibo heartland. Margery Perham writing in *The Listener* (19 September 1968) explained that there was a very wide difference between the Ibo way of life and that of the other major tribes in Nigeria—the Hausa and the Yoruba. This difference had seemed to matter less when all the tribes were held together within the overarching structure of the British government. But with independence and the full tribal competition for power and economic advance certain deep rivalries began to appear. The Hausa (Muslim) and the Yoruba (Muslim and Christian) both belong to old civilisations and are grouped in large city states. The Ibos (mostly Roman Catholic) are poorer, thirstier for education and eager for change. The tension between the main tribal groups led to the assassination in 1966 by Ibo officers of the Hausa Prime Minister Abubakar Tafawa Balewa. General Ironi, an Ibo soldier, tried to impose a unitary system of government but was murdered by non-Ibo soldiers. This tragic civil war seen by millions on their television screens evoked a response for practical action and Lord Hunt and his mission were successful in organising help.

The Federal Military Government said that military operations would cease immediately if Colonel Ojukwu and his associates would agree to renounce secession, remain part of Nigeria and accept the new structure of the Federation based on the 12 states including the South-Eastern and Rivers States.

The end of the civil war after a period of apparent stalemate came in the space of a few days at the beginning of 1970. Federal troops captured Owerri headquarters of the secessionist régime together with Uli airstrip through which relief supplies had reached Biafra. Colonel Ojukwu departed leaving Colonel Effiong in charge of affairs. Colonel Effiong called on his troops to stop fighting and sued for peace. The civil war was formally ended on 15 January. The conduct of the Federal Military Government and of Federal forces was reported to be notable for its generosity and spirit of reconciliation. Predictions of vengeance and even genocide against the Ibo people which had gained a wide currency largely as a result of Biafran propaganda were in the event proved to be unfounded. As soon as the fighting was over the Nigerian Government set about the task of relieving hunger and suffering in the war-affected areas. While accepting many of the offers of aid which flowed in from friendly countries the Government kept the administration of the relief programme firmly in its own hands.

The Assassination of Verwoerd

Dr Verwoerd who was murdered in September 1966 while the members of the Commonwealth were assembled in Conference in London was the man who gave form and substance to the idea of apartheid, led South Africa into a republic and took her out of the Commonwealth. He studied applied psychology in Germany and on return took an interest in politics, organising in 1936 a protest against the admission to South Africa of a shipload of Jews fleeing from Germany. He became a power behind the scenes in the Nationalist Party which in 1948 ousted the Smuts régime on the slogan of apartheid. He succeeded J. G. Strijdom as Premier in 1959 a year after being elected to the House of Assembly. The Bantu Self Government Act of 1960 provided for the division of the non-white population into tribal units, the abolition of their existing representation in Parliament and the creation of self-governing native states. But the aim of apartheid, the physical separation of races is apart from other objections a dishonest myth as the economy cannot be run without black labour. The call by The Pan African Organisation for a nationwide campaign against the law requiring all African men to carry passes for identification led to the massacre by the police at Sharpeville. Verwoerd banned the two major African political movements, the African National Congress and the Pan African Congress and most African leaders were sent to prison, proscribed or fled. Verwoerd was born in

Holland, a land noted for its enlightened policy of racial integration, but after his return to South Africa from Germany he held the separation of races to be blessed by scriptural authority and as a follower of the Dutch Reformed Church carried his philosophy into politics.

Disension among the Nationalists

A split occurred in the ruling Nationalist Party when Dr Hertzog was dismissed by Mr Vorster as Minister of Health in August 1969. Two other members of the South African House of Assembly were expelled from the party organisation and another resigned. They became known as the *verkrampde* (rigidly conservative) as opposed to the *verligte* (enlightened). They formed the break-away extreme right wing Herstigte (Reformed) National Party.

In the general election held in April 1970 Dr Hertzog and his co-extremists were defeated. Mr Vorster's Nationalist Party lost nine seats to Sir de Villiers Graaf's United Party and suffered a reduction of majorities over a wide front. Mrs Helen Suzman tripled her majority but remained the only representative of the Liberal Progressive Party in Parliament. Interpreting the results for *The Observer*, Anthony Sampson (author of *Anatomy of Britain* and *The New Europeans*) said it would be a misreading of the situation to suppose that Mr Vorster as a result of the defeat of the *verkrampde* and of the gains of the United Party would pursue a more liberal internal policy. Mr Vorster and Sir de Villiers Graaf have been moving for years almost in step towards the Right and in many practical respects the two main white parties are in a coalition. There is nothing self-correcting in the South African political system as in Rhodesia, the exclusion of the majority from the vote leads to a steady, almost unopposed move to the Right. The word *verligte* may not therefore imply any relaxation of apartheid, police powers and ruthless repression of the black population but rather a realisation that for South Africa to maintain her economic growth she must make more use of skilled black labour, expand trade with black Africa and improve her relations with Europe and America. The sports boycott has a significance far beyond the game itself.

Violence and Southern Africa

Violence has begun to erupt over southern Africa. The indecisiveness over Rhodesia, the absence of serious economic pressure on South Africa and on the Portuguese whatever the reasons for this policy have encouraged those ready to use violence. And this applies to the advocates of violence on both sides, black and white. The guerrilla has suddenly become a reckonable factor, said Colin Legum in a part of the world where until a few years ago black violence was unknown. Guerrillas are operating in South-West Africa, in Angola, in Mozambique and in Rhodesia. Until 1966 President Kaunda of Zambia—opposed to violence—was successful in denying guerrillas even passage through Zambia. But he has been unable to resist pressures. In this new and menacing situation Dr Banda, President of Malawi, is in an anomalous position. He has ranged himself with the White Supremacists against the guerrillas by opening diplomatic relations with South Africa. He has become a Black ally of the White Front.

Rhodesia—See Part II

THE UNITED STATES

Assassination of Kennedy

The Assassination of President Kennedy in November 1963 at Dallas, Texas, shocked the entire world. The world recognised the growing mastery which this young man had shown during his three years of office in leadership and commitment to policies which promised increasing conciliation among nations. His youthfulness

had galvanised hope in a world in which political decisions were so widely in the hands of leaders past their prime. He was the youngest elected American President (43) when he succeeded Eisenhower at the White House in January 1961. Eisenhower being then America's oldest President. Kennedy had had difficulties with Congress and it was reassuring therefore that Lyndon B. Johnson who as Vice President automatically succeeded Kennedy should have had the reputation of being a skilful negotiator in Congressional matters.

Cuba and the United States

In 1961 the United States broke off diplomatic relations with Cuba with whom relations had been strained since the Castro revolution of 1959. Shortly afterwards two U.S. aeroplanes but manned by Cubans attacked the principal military bases near Havana the capital. Two days later 1 500 invaders Cuban exiles—armed, trained and largely controlled by U.S. agencies—landed on the island but were driven back. The United States intelligence service had assumed that the Cuban people would rise against Dr. Castro directly they heard of the landing. Controversy broke out in the States. Confidence in the new Kennedy administration was shaken for the affair was fundamentally alien to the American character. Relations were more bitter than ever and by the end of 1961 Cuba became a Communist state in the full sense.

The Crisis of the Autumn of 1962

The world came to the brink of war during the last week of October 1962. President Kennedy had pledged the United States to take measures to oppose the creation of offensive military power in Cuba. On 22 October upon alleged evidence of offensive Soviet missile sites there he announced a blockade of ships (or more precisely a quarantine of ships) carrying weapons to Cuba. Some Soviet ships altered course thus avoiding a direct confrontation. The United Nations made proposals to both sides in preparation for talks and shortly afterwards Khrushchev decided to dismantle Soviet missile bases in Cuba and ship offensive weapons back to the Soviet Union. The United States agreeing to give assurances against an invasion of Cuba which had been threatened.

The Presidential Election 1968

The mid-term Congressional elections of 1966 rehabilitated the Republican Party which had been so Sundered by the rout of Goldwater in 1964. It chose as its Presidential candidate Richard Nixon (who had once been Vice President and a Presidential candidate). On the Democratic side the candidature of Lyndon Johnson was first challenged by Senator Eugene McCarthy who took his stand upon the criticism of America's war in Vietnam and by Senator Robert Kennedy who was later assassinated. The President announced to the nation on 31 March that he would initiate peace moves in Vietnam and lay down the presidency in January. This dramatic turn of events threw the presidential race into confusion. Vice President Humphrey then entered the lists to become the chosen candidate for the Democratic Party. It was one of the most closely contested presidential elections in American history. Nixon, the Republican candidate, having a majority of only 493 704 over Humphrey in a total poll of 72 million. Although securing only a small majority of the popular vote Nixon obtained 301 votes in the Electoral College against Humphrey's 191. In January 1969 he became the 37th President of the United States.

The Nixon Administration

President Nixon's second State of the Union message on 25 February 1971 was in fact a comprehensive statement on U.S. foreign policy. On Vietnam he pointed out the reduction in American forces from 500 000 to under 300 000, a reduction in the casualty rate from 275 to over 50 deaths a week and the halving of the cost of

the war to American taxpayers. The President maintained that the extension of the conflict into Cambodia in 1970 had conclusively demonstrated not only the tactical success of the operations but also their strategic purpose in reducing U.S. involvement in Vietnam.

The Nixon Doctrine

The 65 000 word document contained also a tentative assessment of this policy, which involves the restriction of aid for friends and allies overseas who are victims of aggression or internal subversion to military or economic aid but not unless treaty obligations require it. U.S. troops. Mr. Nixon commented. The Nixon Doctrine is a philosophy of invigorated partnership, not a synonym for American withdrawal. Its positive achievements he said were evidenced by the reduction of troops in Korea, Japan, Okinawa and Thailand.

Defence

Mr. Nixon said that a fresh review of the need for the Safeguard anti-ballistic missile defence system had recently been completed. Defence secretary Mr. Melvin Laird would ask Congress for funds to finance the third stage of the project. Thus as some observers were quick to point out, in spite of a slowdown in the deployment by the Soviet Union of SS-9 missiles and the continuing SALT talks. See also C20(2).

The Problem of Violence

The two final reports of the President's National Committee on the Causes and Prevention of Violence set up by President Johnson in 1968 after the assassination of Senator Robert Kennedy were issued in 1969. Participating in the studies were historians, political scientists, anthropologists, psychiatrists, psychologists, sociologists and lawyers. The first report issued in June 1969 said that Americans had become a rather bloody-minded people in both action and reaction and that in total magnitude of strife the United States ranks first among the 17 Western democracies and since 1948 had been one of the half dozen most tumultuous nations in the world. In suggesting methods to overcome violence in society the final report issued in December 1969 stated. The way in which we can make the greatest progress toward reducing violence in America is by taking the actions necessary to improve the conditions of family and community life for all who live in our cities and especially for the poor who are concentrated in the ghetto slums. The report concluded. When in man's long history other great civilisations fell it was less often from external assault than from internal decay. While serious external dangers remain the graver threats today are internal: haphazard urbanisation, racial discrimination, disfiguring of the environment, unprecedented interdependence, the dislocation of human identity and motivation created by an affluent society—all resulting in a rising tide of individual and group violence. The greatness and durability of most civilisations have been finally determined by how they have responded to these challenges from within. Ours will be no exception.

THE THREAT OF NUCLEAR CONFLICT

Terms Used

A deterrent is a weapons system capable of causing such a degree of destruction to an attacker that it would be too high a price for him to pay for any advantages sought. Of course the attacker may not know what destruction the deterrent could cause so that what is important is not the owner's estimate of his deterrent but the potential aggressor's estimate of it. Furthermore deterrent forces must be able to strike back after an aggressor's missile attack. So there is a distinction between first and second strike weapons. The nuclear deterrent is said to be the ultimate

mate deterrent because nuclear weapons are the most advanced form of weapon

The nuclear or thermonuclear bomb means a bomb or a missile with an explosive power measured in megatons *i.e.* one million times more powerful than bombs used during the Second World War. A ten megaton bomb contains the equivalent of a train of railway wagons filled with high explosive stretching from London to New York—and of course fall out with its genetic effects

The independent bomb Independence in this context means the right and ability to launch a force alone against an aggressor. For this it is necessary to own and control thermonuclear weapons and be able to deliver them. The ability to deliver weapons without which they are useless as a deterrent raises crucial difficulties

It is argued that the bomb like earlier types of armament is the ultimate guarantee of the nation's security that without it we should not reach the conference table with other great powers that it gives us freedom of action and as such is a safeguard against the possibility of a change in American policies which might leave us unprotected. The facts and policy of an independent nuclear deterrent have been seriously challenged

ABM is the anti ballistics missile defence system whereby missiles are launched to destroy the missiles of the enemy—anti missile missiles. Both the U.S.S.R. and U.S.A. are developing an ABM system

MIRV is the American multiple independent re entry vehicle which when it re enters the atmosphere fires off up to 10 warheads each of them aimed with precision at a different target. Its purpose is to penetrate an anti missile defence

SS 9 is the large Soviet missile with a warhead capable of destroying the American Minute man forces

Other terms *Escalation* is a term used for the belief that once a conflict begins which involves nuclear powers the contesting parties are riding on an escalator from which there is no escape and rising to an all out thermonuclear war. A weapon is said to be *credible* when it is trustworthy and it can be believed in for its purposes thus it is sometimes said that the U.K. manned bomber force is credible only for a first strike. *Conventional* weapons and forces are other than nuclear. Atomic devices are described as *tactical* when they are in support of ground forces and *strategic* when they are part of an all out major strike force

The Partial Nuclear Test-Ban Treaty

This important treaty was signed in Moscow in August 1963 between Britain the U.S.A. and the U.S.S.R. who undertook not to conduct nuclear tests in three out of four possible spheres—in the atmosphere in outer space and under water. The fourth possibility—underground tests—was not touched by the Treaty but it declares that agreement on such tests remains a desirable aim. There has been little hope of extending the test ban treaty to underground explosions despite the appeal of the United States to Russia to agree. The U.S. and Britain still disagree with Russia over the question of identifying the nature of all underground explosions. The Western Powers insist that no foolproof method has yet been devised and they cannot therefore accept a ban on nuclear underground explosions without a limited number of on the spot inspections. But this is just what Russia is opposed to on the grounds that this would amount to espionage

Treaty to Prevent Spread of Nuclear Weapons

Ever since 1960 there had been talks on how to prevent the proliferation of the bomb and the round of talks which ended in August 1966 finished without any substantial new progress. The stumbling block was Russia's suspicions that despite declarations by America the arrangements to be made for the future of NATO would give Germany a finger on the nuclear trigger. Talks were resumed at the 18 power Conference at Geneva in February 1967 where a draft treaty was tabled by the U.S. and U.S.S.R. By March 1968 a single text sponsored by both the U.S.S.R. and U.S. emerged containing a number of additions to meet at least some of the demands that had been put forward by the non nuclear Powers. This joint U.S.-Soviet draft treaty was sent to the U.N. General Assembly where it was adopted in June by 95 votes to 4 with 21 abstentions. One of the countries that voted against was India—the American Soviet joint offer of guarantees did not appear to provide the cast iron protection that India might like against China.

The Nuclear Non Proliferation Treaty flowing from this agreed draft was signed in London, Moscow and Washington on 1 July 1968. Britain was the first nuclear weapon power to ratify the treaty on 27 November 1968. It came into force on 5 March 1970.

Nuclear Missile Race

America's decision to enter the anti ballistic missile defence system was announced in September 1967 after the Russians had already begun work on their ABM system around Moscow. Under the old plan there were to be ABM sites around some 15 to 20 cities including Boston, Chicago, Seattle and San Francisco. But there was strong protest from American civilians who were against spending money on more weapons when so much needed to be done in urban development. The present modified system is designed to protect the Minuteman sites. It was described as essentially a safeguard programme to strengthen the American deterrent. At the same time the U.S. is increasing its offensive capability by improving the accuracy of its MIRVs as a counter to the powerful Russian SS 9s. See also Defence 019

Strategic Arms Limitation Talks

These talks begun in Helsinki in 1969 were resumed hopefully in 1970. Moscow did not obstruct U.S. moves to start peace talks on the Middle East. But U.S. distrust of the Soviet Union was apparent again by the end of the year. It was a year which has seen the failing of any prospect of an early agreement. Observers say that the two sides are still far apart but little of the substance of the talks has been revealed.

Outer Space for Peaceful Developments

An international treaty to preserve outer space for peaceful purposes was completed in December 1966. It was described by President Johnson as the most important arms control development since the limited test ban treaty of 1963. Mr Johnson first proposed such a treaty in May 1966 since when there had been extensive talks between the U.S. and Russia the only two powers which are seriously involved in space research. The drafting of the treaty was prepared by the United Nations. It provides for rights of exploration in space for all countries, no claims of sovereignty over celestial bodies, no orbiting of weapons of mass destruction (already provided for in an earlier U.N. resolution), the preservation of space and all celestial bodies for peaceful purposes and other procedures for peaceful co operation among nations in space and in the exploration of space.

Seabed Treaty

A treaty was signed in February 1971 by the three nuclear powers Britain, the U.S. and Russia and by 64 other countries banning nuclear weapons from the seabed.

II POLITICAL STRUCTURES AND INSTITUTIONS

HOW BRITAIN GOVERNS HERSELF

1 THE BRITISH CONSTITUTION

Strictly there is no British Constitution. There is no single document which contains all the rules regulating the operation of our system of government. Indeed many of these rules have not been written down. But this is not to say that there are no constitutional rules. Some are to be found in Acts of Parliament such as the Representation of the People Acts and the Government of Ireland Act of 1920 but these have no special validity which distinguish them from Acts which relate to less important aspects of our national life. Even those which have never been written down can be fairly clearly delineated at any particular time. Therefore although the task is made more difficult by the absence of a formal constitution it is still possible to outline the working of our system of government.

One consequence of the lack of a written constitution has been the gradual evolution of the system over the centuries without any sharp breaks in continuity. Thus although there have been fundamental changes for instance in the role of the monarch many of these changes have not been recorded in any formal manner. Survivals from past ages remain to confuse the student such that it is necessary to distinguish between what Bagehot writing in the 19th cent. called the efficient and dignified elements those parts which were important in the actual running of the country and those parts which remained in existence but now only had a symbolic role.

It is not possible to attach a single label to our system of government which serves to distinguish it from others. A number of labels—monarchical, parliamentary, unitary and democratic—provide a reasonably accurate short description. monarchical in the sense that the Queen is Head of State although she now only plays a formal part in the conduct of the government acting always on the advice of her ministers. parliamentary both in the sense that Parliament is the sovereign law making body and that the government is formed out of Parliament and dependent on its continuing support. unitary in the sense that Parliament is ultimately responsible for all parts of the United Kingdom although it may have chosen to delegate some of its powers to other institutions and democratic in the sense that the House of Commons is elected on a basis of universal adult suffrage.

In the absence of the safeguard of a written constitution democracy is preserved by the ordinary law by the political organisation of the people by custom and by rights which depend on the capacity of the people to sustain them. It is manifested in universal adult suffrage the rule of the majority and the right to oppose. Thus all citizens male and female over the age of eighteen have the right to elect their own member of Parliament and to vote in local elections. Secondly it is accepted that the majority has the right to rule subject to a number of safeguards in particular the right of the minority to oppose. This consideration is vital to a true democracy and opposition is so essentially a part of our system that the Leader of the Opposition is paid a salary by the Government.

Although their functions overlap the three organs of government are easily distinguishable

(i) The legislature consisting of the Queen in Parliament

(ii) The executive consisting of the Cabinet and other ministers in charge of government departments staffed by civil servants local authorities and a number of statutory boards such as the National Coal Board and the Post Office responsible for the administration of particular services

(iii) The Judiciary

2 CENTRAL GOVERNMENT

A STRUCTURE

I THE QUEEN

The Queen's tenure of the Crown holds for life (unless she abdicates) it is hereditary and it is held by statutory right. The Queen is a constitutional monarch she took an oath at her Coronation to rule according to the laws and customs of the people. In law she is head of the executive, an integral part of the legislature and the head of the judiciary as well as being commander in chief of the armed forces and temporal head of the Church of England. Thus the Queen appoints the prime minister and legally other ministers only assume office on receiving their seals of office from the Queen. Equally her assent is necessary before a bill passed by the House of Commons and the House of Lords becomes an Act of Parliament. In practice however the Queen's role is now purely formal. She reigns but she does not rule. She has no freedom of choice in the selection of a prime minister and the power of veto of legislation is never exercised. In all important respects she acts only on the advice of her ministers. In effect the United Kingdom is governed by Her Majesty's Government in the name of the Queen. However the Queen still plays an important role socially as the Head of State. Member countries of the Commonwealth (except Malaysia, Lesotho, Swaziland, Tonga and those which are republics) owe allegiance to the Queen and she is represented by a resident Governor General. All members of the Commonwealth recognise the Queen as Head of the Commonwealth.

II PARLIAMENT

Parliament consists of the Queen, the House of Lords and the House of Commons. Collectively they form the legislature. Over the centuries the balance between the three elements has changed such that the Queen only remains a part of the legislature in a formal sense and that the House of Commons as the popularly elected lower House has established its paramountcy over the House of Lords composed of lords spiritual and lords temporal. The maximum life of a Parliament is five years but on the advice of the prime minister the Queen may dissolve Parliament and issue a proclamation calling for the election of a new Parliament. Parliament is adjourned from day to day while in session. At the end of a session (usually 12 months in length) it is prorogued. At the expiry of its life it is dissolved.

(a) The Parties

To understand the operation of our system of government it is essential to appreciate the importance of the party system. The party system emerged in the latter half of the seventeenth century as Parliament gained the right to be the law making body. Since then there has basically been a two party system, at different times Cavaliers and Roundheads, Tories and Whigs, Conservatives and Liberals and since the 1930s Conservatives and Labour. Parties exist to form governments and the path to this goal lies in the House of Commons for the party which obtains a majority of seats has the right to have its leaders form the government. The other party forms Her Majesty's Opposition. To this end parties are highly disciplined and coherent organisations. Once elected the majority's main function is to sustain the government in power. The minority accepts that because of the rigidity of the party system, it is unlikely to defeat the government in the Commons and therefore sees its role as one of criticising government policy and setting forth an alternative programme which it hopes will win the support of the electorate at the next election. Thus the party system is a major explanation of the relationship between the executive and the legislature and of the role of Parliament.

(b) The House of Lords

The House of Lords is the oldest second chamber in the world and the most hereditary in its character. It is composed of the lords temporal and the lords spiritual. The former includes all peers who inherited their titles and who have not disclaimed their peerages under the Peerage Act 1963 all peers created for their own life times under the provisions of the Life Peerages Act 1958 and the Lords of Appeal appointed to assist the House in its judicial duties. The lords spiritual are the 26 most senior bishops. The hereditary element is still large but of declining importance especially as a result of the more frequent attendance of the life peers and peeresses. This has tended to reduce the overwhelming majority which the Conservative party used to enjoy and which constitutes a threat to legislation in the final year of a Labour government. However the unrepresentative character of the House of Lords has limited its usefulness. Its role is to ease the work load of an overburdened House of Commons but not to thwart its will. It still performs a useful function in the legislative process by examining some bills in detail and initiating bills on non controversial subjects but its part is limited by the Parliament Acts of 1911 and 1949 (see Legislation below). It also serves as the highest Court of Appeal. Finally the House of Lords is a forum where men and women distinguished in all fields of national life can discuss issues of importance free from the restraints of party discipline.

(c) The House of Commons

The House of Commons is a representative assembly consisting of 630 M.P.s elected by simple majority in single member constituencies. Although our system of government is rightly described as parliamentary this does not mean that Parliament governs. Because of the party system the initiative in government lies elsewhere—in the Cabinet. But Parliament and especially the Commons has important functions to play not only as the assembly to which the government is ultimately responsible but also in legitimising legislation in voting money and in acting as a body in which complaints may be raised.

1 Legislation—The law of the United Kingdom consists of common law statute law and equity (see D7-8). Statute law is that part which is made by Parliament and enshrined in Acts of Parliament or statutes of the realm. Any member of Parliament may present a bill after giving formal notice provided that it does not propose the expenditure of public money but the principal bills are introduced by the government based upon its programme outlined at the beginning of each session in the Queen's Speech. In certain cases it is customary for the government to consult interests affected before publicly announcing the details of proposed legislation. In many cases the government will publish either a Green Paper which sets out proposals which are still in a formative stage and to which the government is not committed or a White Paper which outlines the basic objectives of policy and describes the framework in which it is believed the policy should develop. Where legislation is complex and affects many people this pre-legislative consultative process can be very important.

Bills may originate in either House unless they deal with finance or representation when they are always introduced in the Commons. The First Reading is just a formality. The House begins its examination at the Second Reading when the general principles are debated and voted. If they are approved the bill is then referred for detailed clause by clause examination either to a standing committee or by a committee of the Whole House (see Committees of the House below). After the Committee Stage comes the Report Stage when the House considers the bill as reported to it by the committee and decides whether any further changes in individual clauses should be made. The final stage is the Third Reading when the House considers the bill as a whole and votes whether as amended it should become law. If passed it is sent to the Lords where it must go through the same stages. Once passed by both

Houses the bill is sent to the Queen for Royal Assent.

The Lords cannot require the Commons to agree to amendments nor can they delay a bill indefinitely. They have no power in respect of money bills and since the passing of the Parliament Act of 1949 any other public bill which has been passed in the Commons in two successive sessions may be presented for Royal Assent without the consent of the Lords provided that a year has elapsed between the date of the Second Reading of the bill in the Commons and the date on which it was finally passed in that House.

2 Money Functions of the Commons—The second function of the Commons (and one of its earliest in history) is to provide the State with money. The government cannot raise money by taxation (or in any other way) or spend money without the authority of Parliament and this power of authority belongs exclusively to the Commons. The House can vote money only on the demand and on the responsibility of a minister of the Crown. The financial procedures of the House are discussed in Public Expenditure Procedure below.

3 Critical Functions of the Commons—There are a number of opportunities for the Opposition and the Government's own back benchers to criticise government policy. They can question ministers on the floor of the House and have the right to ask a supplementary question to the reply. They can table motions for debate which may help to mould public opinion. They can speak in debates and can raise issues which do not involve public expenditure on the adjournment or under the 10 minute rule or by promoting private members' bills (subject to success in the ballot for places). Ultimately this position is based on the ability of the Commons to withdraw its support from a government by voting a motion of no confidence which would end its resignation. If it resigns then a general election probably geared to the issue in question will result if the prime minister advises the Queen to dissolve Parliament. But a defeat on a motion of confidence does not necessarily result in a general election if an alternative government based on a majority of members is readily available. Because of the predominance of two parties it is many years since such a situation has arisen in this country. Should such conditions recur however back bench M.P.s would find they were able to exercise considerable powers which for a long time have lain dormant.

To assist it in its critical role Parliament has since 1967 had a new officer the Parliamentary Commissioner for Administration commonly known as the Ombudsman. His function is to investigate complaints of maladministration which are referred to him by M.P.s on behalf of their constituents. In establishing such a post the House recognised that there were deficiencies in the method of investigating by questions and letters to ministers.

4 Committees of the House—The House of Commons uses committees to assist it in its work in a number of different ways.

1 Standing Committees—A standing committee is a miniature of the House itself reflecting its party composition and consists of between 20 and 50 M.P.s. Its function is to examine the Committee Stage of legislation. Some bills are not sent to a standing committee but are examined by a committee of the Whole House which consists of all M.P.s but working under special rules of procedure for instance enabling an M.P. to speak more than once to the same question.

2 Select Committees—A select committee is a body with special powers and privileges to which the House has delegated its authority in a special way for the purpose of discovering information examining witnesses sifting evidence and drawing up conclusions which are reported to the House. As well as *ad hoc* select committees there are a number of permanent select committees which are

almost permanent bodies (such as the Committee of Public Accounts, the Estimates Committee and the Committee of Privileges.) (See Specialised Committees C24(2))

(3) **Joint Committees**—A joint committee consists of members of both Houses. It is really a select committee of the Commons deliberating with a select committee of the Lords and is used to save duplication of effort usually on uncontroversial matters.

(4) **Private Bill Committees**—A private bill is a special kind of legislation conferring particular powers on any person or body of persons such as local authorities in excess of the general law. Private Bill committees deal with the Committee Stage of such bills.

III THE EXECUTIVE

The executive work of central government is performed by the prime minister and the other ministers of the Crown. The power of executive action is not given to a government department as a corporate body but to the minister individually who is responsible for the exercise of his duties legally to the Queen and politically to Parliament. All ministers must be members of either the Commons or the Lords.

At the head of the government structure is the Cabinet which is responsible for defining the broad lines of policy of the government and for coordinating its work in different fields. It consists of the leading members of the majority party in the Commons selected by the prime minister most of whom are heads of government departments which are staffed by civil servants and responsible for the implementation of government policy in particular fields. In addition there are usually a number of ministers without departmental responsibilities. Its normal size is about 20. Although legally the Cabinet has no corporate constitutional existence, ministers being individually responsible for the exercise of governmental powers, politically it is accepted that the Cabinet is collectively responsible for government policy. Thus the Cabinet acts as one man and a minister who disagrees with the Cabinet must either resign or remain silent.

The head of the government is the prime minister. He is the leader of the majority party in the House of Commons and is responsible for choosing the other members of the government. He takes the chair at meetings of the Cabinet and while he has few specific responsibilities, not having a department of his own (although the present Prime Minister is also Minister for the Civil Service), he takes a lead on most of the important aspects of government policy. It is now argued by some commentators that the prime minister is so powerful that he is able to dominate his Cabinet such that they are his servants rather than his colleagues.

Although both the Cabinet and the office of prime minister have long histories it is only recently that they have been given formal recognition in law. The fundamental rules of the working of the executive remain informal and within limits vary according to political circumstances.

1 The Civil Service

The Civil Service is the body of permanent officials who working in the different departments and ministries administer the policy of the central government. It consists of some 700,000 people (2.7 per cent of the working population) of whom 490,000 are non-industrial civil servants and the rest industrial workers in places such as the Royal Ordnance Factories and the Royal Naval Dockyards. It is important to realise that seven out of every ten civil servants work outside London mainly in the regional and local offices of departments such as Health and Social Security, Employment and Inland Revenue.

The political head of each department is a minister. Very often the minister has no special knowledge or experience in the field to which he is appointed and his tenure of office may be fairly short-lived. Great responsibility therefore falls

on the shoulders of the permanent civil servants in his department. They have to ensure that he receives all the relevant facts on which to base decisions and usually he will seek their advice before reaching a decision. The precise relationship between a minister and his senior civil service advisers is a complex and subtle one. On the one hand they are entirely his servants in that he alone is responsible for everything that goes on in the department and he alone can be called to account in Parliament. Civil servants remain largely anonymous and their relationship with their minister is a confidential one. On the other hand the expertise and experience of senior civil servants is such that he depends on them and they can dominate a minister who is not sure of his own mind and who is not backed by the Cabinet as a whole. However the distinguishing feature of the British Civil Service is that at all levels it is non-political in the sense that it serves both political parties impartially.

The non-industrial Civil Service is divided at present into occupational groups known as classes. On the administrative side there are three Service-wide classes: the Administrative Class (2,800), the Executive Class (31,500) and the Clerical Class (1,200,000).

(a) The Fulton Reforms

The most recent inquiry into the Civil Service was carried out by the Fulton Committee who in 1968 reported that while the Civil Service had many strengths it was felt to be inadequate in six main respects. These were:

(a) It was still too much based on the philosophy of the amateur (or generalist or all rounder). This was most evident in the Administrative Class which holds the dominant position in the service.

(b) The present system of classes in the service (there are over 1,400 each for the most part with its own separate pay and career structure) seriously impeded its work.

(c) Scientists, engineers and members of other specialist classes were frequently given neither the full responsibilities and opportunities nor the corresponding authority they ought to have.

(d) Too few civil servants were skilled managers.

(e) There was not enough contact between the service and the community it is there to serve.

(f) Personnel management and career planning were inadequate.

The Committee went on to recommend:

(1) The establishment of a new Civil Service Department to absorb the recruitment and selection functions of the present Civil Service Commission and to take over the responsibilities for central management of the Service at present carried by the Treasury but on an expanded scale. The new Department to be accountable to the prime minister with day to day responsibility delegated to a non-departmental minister of Cabinet rank. The official head of the new Department (the Permanent Secretary) to be designated Head of the Home Civil Service.

(2) The abolition of the class system in the Civil Service. All classes to be abolished and replaced by a single managerial class of civil servant combining the present Administrative and Executive classes. A unified grading structure to cover the entire Civil Service, each post graded by the technique of job evaluation.

(3) The development of greater professionalism in the Service. Professional and technical officers (i.e. specialists) to be given more training in management and opportunities for greater responsibility and wider careers. Administrators to develop a fuller professionalism by specialising especially in their early years in particular areas of government e.g. in economic and financial affairs or social policy.

(4) The establishment of a Civil Service College to provide training courses in management and organisation and in research. Not restricted to civil servants.

(5) In addition to the permanent secretary who has overall responsibility under the minister for the running of a department the minister should also have a senior policy adviser who would normally be head of the planning and research unit to be set up within departments for major long term policy planning. The main task of the new adviser would be to look to and prepare for the future and to ensure that current policy decisions were taken with as full recognition as possible of likely future developments.

(6) The delegation to departments of a larger role in recruitment and the speeding up of recruitment procedures.

(7) The devotion of more resources to the career management of all civil servants so that they have the opportunity of advancing on their merits.

(8) The encouragement of greater mobility between the Civil Service and other employments through a reform of the restrictions on the transfer of pensions. The Committee recommend an expanded late entry temporary appointments short term exchanges of staff freer movement out of the Service.

(b) Implementation

(1) The Civil Service Department was established in November 1968 on the lines proposed by the Committee.

(2) The Government accepts the abolition of classes and the introduction of a unified grading structure. As interim measures while such a structure is developed jobs at the top of the Service have been made open to all classes and on 1 January 1971 the Administrative Executive and Clerical Classes were to be merged.

(3) The Civil Service College started running courses in autumn 1970 in two residential centres at Summardale Park and Edinburgh. In addition the Centre for Administrative Studies in Regent's Park has been expanded.

IV THE JUDICIARY

The judiciary is responsible for the interpretation of statutes and the determination of the common law. Judicial functions are exercised quite separately from legislative or executive functions. However there are some links in personnel. Judges are appointed by the Queen acting on the advice of ministers but to safeguard their independence all senior judges can only be removed by the Sovereign on an address presented by both Houses of Parliament. The Lord Chancellor the head of the judiciary is the only political appointment who as a member of the Cabinet resigns his position with a change of government. He also serves as Speaker of the House of Lords. The Lords of Appeal are members of the House of Lords. See English Law D7-8.

B REFORM OF GOVERNMENT

1 Machinery of Government

In October 1970 the Government published a White Paper entitled *The Reorganisation of Central Government* (Cmd 4506) the first official publication on the machinery of government since the Report of the Haldane Committee of 1918. It proposed a number of changes in the division of functions between departments and the establishment of a new central policy review staff. Continuing the developments of recent years towards the unification of functions within single departments, as seen, for instance in the Ministry of Defence and the Department of Health and Social Security the White Paper proposed the merging of the Ministry of Technology and the Board of Trade in a new Department of Trade and Industry and the creation of a new Department of

the Environment by integrating the Ministry of Housing and Local Government the Ministry of Transport and the Ministry of Public Buildings and Works. A number of other minor changes in ministerial responsibilities and departmental organisation were also proposed. By the end of 1970 all these changes had been effected.

The other most important feature of the White Paper was the establishment of a small multi disciplinary central review staff within the Cabinet Office. Under the supervision of the Prime Minister it is to work for ministers collectively outlining for the Cabinet as a whole the wider implications of every Government programme. A novel concept in British Government it is not possible at this stage to predict how it will operate. The intention however was that the review staff should act as a counter balancing force for members of the Cabinet when considering the proposals of individual ministers, who had the backing of their departmental staffs. The Prime Minister has appointed Lord Rothschild to head the new unit.

2 Public Expenditure Procedure

Since 1945 growing attention has been paid to the planning of public expenditure both as a result of its increasing size and because of its vital role in the management of the economy. New techniques for the planning and examination of public expenditure have been adopted by the spending departments and by the Treasury. However Parliament's scrutiny of government spending has not kept pace with these developments. The House of Commons still considers expenditure on an annual cash basis its procedure being centred around the annual voting of Supply. Most government expenditure however requires planning over a number of years ahead. The House has no machinery for examining the long term priorities and resource implications of public expenditure.

This situation was examined by the Select Committee on Procedure during the 1968-69 Session. It received a large amount of written evidence including a Green Paper published by the government *Public Expenditure: A New Presentation* (Cmd 4017). This announced that the government intended to publish an annual White Paper towards the end of the calendar year which would present to Parliament the results of the government's consideration of the prospects for public expenditure bringing out the main implications for resources over the period ahead. It was intended that the White Paper should be debated and that this annual discussion should come to occupy as important a place as is now occupied by the annual Budget debate. The Report of the Select Committee in July 1969 welcomed the government's proposals and also recommended that the Estimates Committee at present operating under restricting terms of reference and precluded from direct examination of policy be changed to a Select Committee on Expenditure with general terms of reference to consider public expenditure.

The first such White Paper was published in December 1969 as *Public Expenditure 1968-69 to 1973-74* (Cmd 4284). It set out the government's plans for public expenditure for the financial year 1969-70 and for the next two years. It also gave allocations of expenditure on a provisional and approximate basis for 1972-3 and 1973-4. The White Paper was debated in the House of Commons on 21 and 22 January 1970. The proposal for a Select Committee on Expenditure was considered by the new government in 1970 and its conclusions published as a Green Paper (see below).

3 Specialised Committees

In 1966 as one of the procedural reforms introduced by Mr Crossman the Leader of the House the government proposed the establishment of a number of specialised select committees to investigate particular areas of policy or the activities of particular departments. Between 1966 and 1970 six such committees were appointed and they produced a large number of reports. On taking office the Conservative government an

nounced that it would review this experiment especially in the light of the Report of the Select Committee on Procedure which recommended the establishment of a Select Committee on Expenditure to replace the Estimates Committee.

In October 1970 the results of this review were published as a Green Paper *Select Committees of the House of Commons* (Cmd 4507). It proposed a dual system of some specialised committees and an expenditure committee. On the one hand the Select Committee on Nationalised Industries was to be retained along with a number of specialised committees dealing with particular subjects but not with individual departments. The Estimates Committee was also to be enlarged and transformed into an Expenditure Committee which would focus not on the Supply Estimates but on the longer term and wider implications of public expenditure as a whole and which would not be barred from considering the policies behind the figures. It would be organised into sub-committees covering different subject areas. It was intended to establish the Expenditure Committee early in 1971. At the end of 1970 select committees on Nationalised Industries, Race Relations and Immigration, Science and Technology and Scottish Affairs had been appointed.

4. Commission on the Constitution

In February 1969 a Royal Commission was appointed under the chairmanship of Lord Crowther with the following terms of reference:

To examine the present functions of the central legislature and government in relation to the several countries, nations and regions of the United Kingdom to consider having regard to the development in local government organisation and in the administrative and other relationships between the various parts of the United Kingdom and to the interests of the prosperity and good government of our people under the Crown whether any changes are desirable in these functions or otherwise in present constitutional and economic relations to consider also whether any changes are desirable in the constitutional and economic relationships between the United Kingdom and the Channel Islands and the Isle of Man. It is expected to report in late 1971 or early 1972.

C THE WORKING OF GOVERNMENT 1970

Two of the most important policies advocated by the Conservative Party in Opposition and during the election campaign were reform of industrial relations and reductions in public expenditure. Immediately on assuming office steps were taken to put these policies into practice.

1 Industrial Relations Reform

Industrial relations have been in the forefront of political controversy for a number of years particularly since the Report of the Donovan Commission in 1968. In 1969 the Labour government proposed an Industrial Relations Bill based on its White Paper *In Place of Strife* (Cmd 3623) but after prolonged discussions with the TUC it agreed to abandon it in favour of the TUC's pledge to take action itself to deal with strikes. At the time the Conservative party announced that they did not regard this solution as adequate and during the election campaign they made clear their intention to introduce a comprehensive bill during the first session of the new Parliament.

Their proposals were published as a Consultative Document by the Department of Employment in October 1970. In some respects they resemble those of the Labour government for instance in cases of national emergency there is provision for a compulsory cooling off period and for the holding of strike ballots but in other respects they differ substantially. The two basic principles behind their proposals are that collective agreements should be legally binding and enforceable unless the parties to the agreement expressly declare otherwise and secondly that a Code of Industrial Relations Practice should be drawn up which would list a number of unfair industrial

actions. To enforce these provisions the government proposes to establish two new statutory agencies and to strengthen a third. A new system of courts for dealing with industrial relations questions is to be created consisting of a National Industrial Relations Court of equivalent status to the High Court and at a lower level of Industrial Tribunals. The courts would be able to award compensation up to a limit of £100 000 in the case of large trade unions and they could make orders to refrain from unfair industrial action. Secondly a Registrar of Trade Unions and Employers' Associations is to be appointed to ensure that the two sides' rules are up to standard and are upheld. To qualify for the legal benefits and immunities under the Act, a trade union must secure authorisation by registering with the Registrar. Thirdly the government intends to put the Commission on Industrial Relations at present constituted as a Royal Commission on a statutory basis and to give it new powers and added responsibilities. The government also propose that each worker should have the right both to join and not to join a union that periods of notice of dismissal should increase with length of service that workers should have the right of appeal to an Industrial Tribunal if they consider they have been unfairly dismissed that the pre-entry closed shop should be outlawed and that large firms should give regular shareholder-type reports to their employees.

These proposals were contained in an Industrial Relations Bill which passed its Second Reading in the House of Commons on 15 December 1970. The government hope that the Bill will be presented for Royal Assent in July 1971 and intend that it should come into effect in 1973.

2 Cuts in Public Expenditure

During the 1970 summer recess the Government undertook a thoroughgoing examination of the work of government and other public authorities. This review was based on a belief that the government was intervening too much in the life of the nation and that too high a proportion of the nation's resources were committed to public expenditure. Its main objectives were to reduce the sphere of government so that it could concentrate its activities and its expenditure on those tasks which it alone could perform and to enable both private industry and the individual citizen to enjoy greater freedom from government interference. The first results of this review were announced in a ministerial statement by the Chancellor of the Exchequer on 27 October 1970.

The main features of the government's decisions were a more selective approach to the social services and a general withdrawal in its relations with private industry. In the former category the government proposed to end cheap welfare milk and the supply of free milk to pupils over the age of 7 to abolish the present system of housing subsidies, rents and rebates substituting a system which would give help where it was most needed to raise the charge for school meals to fix the charge for dental treatment at about half the cost of the service provided and to relate the charge for prescriptions more closely to their cost and as an interim measure to raise the charge to 20p per item. Some of the money saved in this way is to be spent in giving a new benefit to one of the poorest sections of the community. The Family Income Supplement is to be paid in addition to existing benefits to poor families with children where the wage earner is in full time work the level of benefit being based on a simple test of income. In the latter category the government proposed to end the Industrial Reorganisation Corporation to discontinue the Regional Employment Premium by the end of 1974 and to abolish investment grants replacing them with a system of tax allowances and reductions. Other cuts in public expenditure included the introduction of a system of import levies of charges for admission to national museums and galleries and the elimination of the grant to London commuter services and to the Consumer Council. Some of the resources released in this way were to be used to increase expenditure on educational building especially for the replacement and modernisation of primary schools to develop the health and welfare services, especially for the elderly and the mentally handicapped.

capped and to increase slightly the overseas aid programme

Although some of the decisions were put into effect immediately many were announcements of the long term intentions of the government. See also Section G Part IV under Internal Developments

3 Recent Legislation

The legislative output of Parliament in 1970 was limited as a result of the dissolution in May. A number of major bills such as the National Superannuation and Social Insurance Bill the Ports Bill the Commission for Industry and Manpower Bill and the Education Bill were lost for this reason. Among the Acts which reached the statute book before the dissolution were the following:

Administration of Justice Act 1970 makes important alterations in the jurisdiction of the High Court and abolishes the power of imprisonment for civil debt. See D6

Equal Pay (No. 2) Act 1970 makes discrimination in pay and terms and conditions of employment on grounds of sex illegal by the end of 1975

Chronically Sick and Disabled Persons Act 1970 provides for a large number of measures to improve the welfare of chronically sick and disabled persons. A private member's bill introduced by Mr Alfred Morris it was hailed as a charter for the disabled. In particular it makes the provision of a number of services formerly permissive mandatory upon local authorities

Local Authorities Social Services Act 1970 unifies the administration of the personal social services within each local authority area in England and Wales thus implementing the main recommendation of the Seebohm Committee (Cmd 3703)

Matrimonial Proceedings and Property Act 1970 following the passage of the Divorce Reform Act in 1969 it increases the power of the courts in dealing with a spouse's property on the breakdown of a marriage allowing the courts to reallocate family assets. See D33

Police Act 1970 and Ulster Defence Regiment Act 1970 together implement the recommendation of Lord Hunt's Advisory Committee on the Police in Northern Ireland that the police and military roles should be separated. The Acts disbanded the 'B' Specials and removed military duties from the Royal Ulster Constabulary and provided for a voluntary police reserve to assist the RUC and a locally recruited part time force under the command of GOC Northern Ireland to support the regular military forces

Murder (Abolition of Death Penalty) Act 1965 The Act provided for the abolition of the death penalty until July 1970. In December 1969 both Houses approved resolutions extending the abolition indefinitely. See D10(1)

The following Acts and Orders are among those already passed by the new Parliament

National Insurance (Old Persons and Widows Pensions and Attendance Allowance) Act 1970 provides retirement pensions for those who were excluded by their age from participation in the national insurance scheme which came into operation in 1948 widows' pensions for certain younger widows and an allowance for the seriously ill who require constant attention or supervision

Parliamentary Constituencies Orders 1970 implementing the recommendations of the Boundary Commissioners

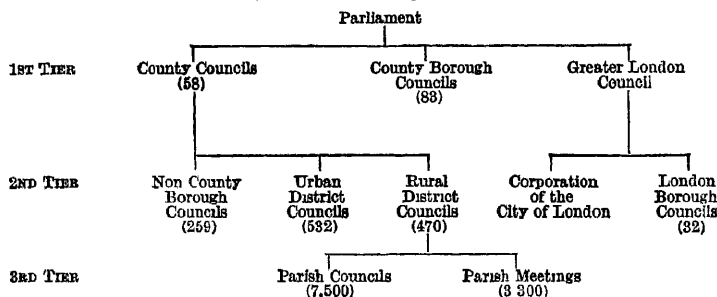

British Standard Time Act 1968 The order which would have made British Standard Time permanent was rejected. From 1971 there will be a return to Greenwich Mean Time during the winter

The Queen's Speech (July 1970) contained proposals to reform industrial relations to abolish the Land Commission, to alter the administration of justice in accordance with the recommendations of the Royal Commission on Assizes and Quarter Sessions and to bring the arrangements for admitting Commonwealth citizens into Britain for employment into line with the arrangements for aliens. Among the bills which had passed their Second Reading by the end of 1970 were the Industrial Relations Bill the Family Income Supplement Bill the Local Government (Qualification of Members) Bill the Misuse of Drugs Bill and the Unsolicited Goods and Services Bill

II LOCAL GOVERNMENT

Local government is the creation of Parliament. The structure and boundaries of local authorities are laid down by Parliament and they may only exercise those powers which Parliament either commands or permits them to exercise. Their functions include responsibility for all education except the universities most personal health and welfare services public health environmental planning traffic and transport in all cases subject to some central government control. England and Wales (outside the Greater London area) are at present divided into county boroughs and administrative counties. The structure as the chart shows is split vertically on the one side are the administrative counties subdivided into county districts—non county boroughs urban districts and rural districts the last named being further divided into parishes and on the other side are the county boroughs (mostly with populations of over 75 000) local government being in the hands of one authority the county borough council. In Scotland there are 33 county councils (two pairs being combined for certain purposes) 201 town councils (including 4 counties of cities) and 196 district councils (2 counties not being divided into districts). The Greater London area is administered by the councils of 32 London boroughs and the City of London and by the Greater London Council

Local Government in England and Wales

1 Local Government in Greater London

The London Government Act 1963 involved the abolition of the London County Council and the Middlesex County Council and parts of Essex, Surrey, Kent and Hertfordshire have been incorporated in Greater London which now covers the whole of the continuously developed area within the green belt. The system came fully into effect on 1 April 1965.

The London Boroughs—There are 32 London boroughs and the population of each is between 170 000 and 340 000. Broadly speaking the new boroughs are responsible for all the important personal services such as housing, health and welfare. Each council has a maximum of 60 directly elected councillors plus aldermen up to one sixth making a maximum of 70. The councillors retire together every three years (one year after the GLC elections). The independent position of the City of London remains unchanged and it has the powers of a borough.

The Greater London Council a directly elected body carries out functions which need to be planned and administered over Greater London as a whole and consists of 100 councillors and 16 aldermen. The new councils in Greater London came into existence as local authorities when they were elected—the GLC on 9 April 1964 and the London borough councils on 7 May 1964—and from then until 1 April 1965 the new authorities and the old continued side by side. On 1 April 1965 the new councils took over their full functions and the older authorities ceased to exist.

Elections for the Greater London Council—For the first three elections held in 1964, 1967 and 1970 each of the 32 London boroughs was also the electoral area and returned two, three or four councillors according to the size of the electorate in each area. These electoral arrangements may however be changed for future elections and it is possible that the number of electoral areas will be increased and will probably return one councillor only based upon the new Parliamentary constituencies as envisaged in the London Government Act 1963.

The Powers of London Boroughs—Each London borough is a housing authority although the Greater London Council is the overspill authority. Local development plans are drawn up by the boroughs (within the framework of the overall development plan of the GLC) and the boroughs are responsible for dealing with applications for planning permission. They are wholly responsible for a wide range of personal health services and welfare services for the elderly, the sick and the handicapped, and children's services. The GLC will complete the LCC housing programme and for the time being inherits the LCC stock of houses (about 230 000) and will eventually transfer them to the boroughs.

Education in Greater London—In Inner London virtually the ex LCC area education is the responsibility of a special committee of the Greater London Council, the Inner London Education Authority consisting of members of the GLC elected from the central area together with a representative of each London borough council and of the City of London. The ILA maintains the education service and decides the amount of money needed to be raised by precepts on Inner London borough councils and by borrowing. The education committee established by the ILA consists of the members of the Authority together with 16 other persons chosen from people experienced in education. The unique arrangements for education in Inner London preserve the continuity of the service which has developed since 1870 as a unity without regard to local boundary divisions. In the Outer London area education is the responsibility of the borough council.

Highways and Traffic—The GLC is the traffic authority for the whole of Greater London. Metropolitan roads come under the GLC and

the new boroughs take the remaining roads except trunk roads which the Ministry of Transport continues to look after. In 1970 the GLC took over responsibility for London Transport.

Other Functions—The GLC is responsible for fire and ambulance services for refuse disposal and main sewerage. It is responsible also for places like the Royal Festival Hall, the Crystal Palace, the LCC museums and Kenwood House.

Greater London Development Plan—A report *Tomorrow's London* published by the GLC in November 1969 tells of plans to improve the quality of living within the Greater London area while preserving the position and status of the capital. The council is concerned not only with providing better amenities for those who live and work in London but also for those who visit the capital.

The population of Greater London declined between 1939 and 1969 from 8.6 million to 7.9 million. Ninety thousand more people leave the capital each year than come to settle there. The report says the aim is not to have the largest population in the world—we cheerfully cede this distinction to New York, Tokyo or São Paulo—but to concentrate on beauty and amenity. The council affirmed its intention to preserve London's green belt (an area of countryside surrounding the city in which building is severely restricted). In December 1969 the Secretary of State for Local Government and Regional Planning, Mr Anthony Crosland, announced his intention to appoint a committee of inquiry into the Greater London Development Plan which he described as a comprehensive complex and controversial.

2 Proposals for the Reform of Local Government Report of Royal Commission

1 England (except London)

The proposals for the reform of local government in England outside the Greater London area were published on 11 June 1969 (Cmd 4039). The Royal Commission was set up in 1966 under the chairmanship of Lord Redcliffe Maud and took evidence from 2156 witnesses. Their findings were contained in three volumes comprising the main report, Mr Derek Senor's substantial memorandum of dissent and research appendices.

The structure of local government in England and Wales dates from the 1830s. The report began by pointing out the need for reform: the need for the structure of local government to catch up with the effects of scientific discovery and industrial progress which have so rapidly reshaped our lives and the need for local self government to assist the individual at a time when huge unrepresentative organisations seem to control our lives. Local government should be the means whereby citizens bring their views to bear on public problems which touch most nearly to personal domestic life. There was a need for a new structure and a new map. If local self government withers, the roots of democracy grow dry. The Royal Commission said local government must do four things:

- (i) perform specific tasks efficiently
- (ii) attract and hold the attention of citizens
- (iii) develop strength to deal with central government as a partner
- (iv) adapt itself to the changing pattern of people's lives, work, movements, shopping arrangements etc.

It found that the present system was suffering from three major defects:

- (i) local government areas do not fit the present day pattern of life and work in modern England. The gap will widen as social, economic and technological changes quicken.
- (ii) the division between county boroughs and counties which was intended in 1888 to reflect the separation of town and country

has made the planning of development and transportation impossible. The result has often been an atmosphere of hostility between county boroughs and counties

(iii) the division of responsibility between county councils and county district councils in the counties means that services which should be in the hands of one authority are fragmented among several. The difficulty of meeting comprehensively the needs of families and individuals is thus greatly increased

These faults in turn make people feel local government cannot help them make Parliament doubt the ability of local government to function effectively while the variety in type of authority makes a single local government lobby almost impossible to achieve for negotiation with the government

The Royal Commission's solution was based on the following general principles

(i) areas should be so defined that they enable electors and councillors to have a sense of common purpose

(ii) areas should be based on the inter dependence of town and country

(iii) impersonal services (e.g. planning transport and major development) should be in the hands of one authority

In these areas responsibilities would be allocated at two levels the main metropolitan authority being responsible for planning transport and major development. Smaller district authorities (7 in Birmingham, 4 in Liverpool and 9 in Manchester) would have responsibility for education, social services, health and housing

Below the new unitary authorities existing councils (ranging from city councils like Leeds to parish councils) could remain but their purpose would be mainly to act as a sounding board of public opinion. In this purely advisory capacity they would have authority only in minor matters like car parks and community halls unless the new local authority agreed to devolve precise powers

Above the new authorities would be 8 provinces with advisory powers only unless given more on the recommendation of the Constitutional Commission which has yet to report. They would take over the job being done by the regional economic planning councils. They would prepare provincial plans which might be binding on the local authorities. Their members would be selected by the local authorities with provision for substantial co-option and they would be unpaid

On financial matters the Royal Commission urged that the opportunity offered by reorganisation be taken to examine the short

Province	No of authorities		Area (mile ²)	Population (1968)
	Unitary areas	Met areas		
North East	5		3 639	2 749 000
Yorkshire	10		5 681	4 549 000
North West	6	2	5 402	8 990 000
West Midlands	4	1	5 169	5 164 000
East Midlands	4		4 574	3 017 000
South West	8		9 408	4 061 000
East Anglia	4		5 889	1 990 000
South East (excl Greater London)	17		10 008	9 289 000
	58	3		38 109 000

(iv) all personal services (e.g. education, social services, health and housing) should be in the hands of one authority

(v) if possible both the impersonal and the personal group of services should be in the hands of a single authority

(vi) authorities should be larger than most existing county boroughs if they are to command the resources in revenue and manpower they need

(vii) the size of authorities is bound to vary but a minimum population of 250 000 is desirable

(viii) councillors should be able to keep in touch with electors and thus for personal services an authority ought not to exceed a million persons

(ix) where the area required for planning and other impersonal services contains too large a population for the personal services there should be a two tier system established akin to that already in operation in Greater London

(x) wherever possible the new system should respect the traditions and loyalties of the present system

These principles in application led to the recommendation that the existing 1 210 local authorities in England (79 county boroughs, 45 county councils, 227 non county boroughs, 449 urban districts and 410 rural districts) should be replaced by

58 single tier all purpose authorities called unitary authorities and

3 metropolitan authorities covering the Birmingham, Liverpool and Manchester conurbations

comings of present day local government finance and to remove them. Pointing out that the Exchequer currently accounts for 52 per cent of all local government expenditure the Royal Commission emphasised that unless local taxation of all types were reformed and expanded the new authorities would be cramped and handicapped

In his memorandum of dissent Mr. Derek Senior argued that England's highly diversified community structure does not lend itself to a pattern of unitary authorities with a pre-determined range of population size. He believes that the areas suitable for the planning and execution of regional development and those for the administration of the social services have little correlation. Accordingly he recommends that a two level structure of local government be introduced with 85 regional development authorities controlling planning, transport, investment, police, education and 148 second level authorities controlling health, welfare, child care, housing, management, consumer protection and all other functions involving personal contact with the citizen

Although the Conservative government does not accept the recommendations of the Royal Commission the Secretary of State for the Environment emphasised that its report must be the starting point for any discussion of local government reform

Government Proposals—The Government's own proposals for reform were published as a White Paper *Local Government in England* (Cmd 4584) in February 1971. The government rejects the unitary principle which Redcliffe Maud recommended for England outside the metropolitan areas and proposes to establish a two tier system throughout the country based on 44 counties outside Greater London. If the plans are put into effect the present framework of county councils and their districts and county boroughs

consisting in all of about 1200 authorities will be replaced by a uniform two level structure of counties and districts numbering only 370 authorities. Existing county boundaries are to be retained wherever possible although certain counties such as Huntingdon and Peterborough Hereford Rutland and Cumberland and Westmorland will not survive as separate counties. Within the counties existing boroughs and districts will be rationalised to provide districts with resources to enable them to carry out efficiently their responsibilities. The bigger cities and towns will retain their identities but smaller towns will be joined with associated rural areas to form new districts. Districts will continue to vary in size but the minimum population is expected to be 40 000.

All local government functions in relation to education personal social services highways traffic and transport police and fire services are to be exercised by the county authorities. The district authorities are to be responsible for housing and local amenity functions. Planning is to be divided between the two tiers the majority of planning control decisions being taken by the district authorities within the broad planning policies established by the county authorities. A unified planning staff will advise both tiers.

A different pattern is proposed for six predominantly urban areas the metropolitan areas which must be treated as single entities for important functions such as land use planning and transport. Metropolitan counties are proposed for Merseyside South East Lancashire and North East Cheshire (Selnece) the West Midlands West Yorkshire South Yorkshire and the Tyne and Wear area and the boundaries of these areas are drawn so as to include all the main areas of continuous development and some immediately adjacent areas. Within the metropolitan counties the districts are large enough in population and resources and sufficiently compact in size to be responsible for education and personal social services.

The Government's proposals for the boundaries of the new counties everywhere and of the new districts in the metropolitan counties were published in a departmental circular issued to local authorities for consultation. Within the new counties outside the metropolitan areas the Government intend to establish a Local Government Boundary Commission to make recommendations regarding the final pattern of the new districts.

The Government aim to introduce a bill to put its proposals into effect during the 1971-72 session. The boundaries of the counties and the metropolitan districts will be laid down in the bill and elections could be held in spring 1973. Parliament could give effect to the district boundaries by order at the end of 1972 and elections for these authorities could be held towards the end of 1973. The new councils would take over from the existing authorities on 1 April 1974.

2 Scotland

The Royal Commission set up in 1966 under the chairmanship of Lord Wheatley published its report on 25 September 1969. Its description of the defects of the existing system made similar reading to the Maud report. The old unreformed structure had led to a loss of power at the local level to confusion hostility between different types of authorities and above all to loss of credibility and status in the eyes of the public. The Commission considered the main requirements of a radically reformed system to be better planning so making it possible to organise and provide better services for the public and more effective local democracy. To this end the majority recommended the replacement of the existing 480 authorities (4 cities 38 county councils, 21 large burghs 176 small burghs 196 district councils) by a two tier system consisting of 7 regions and 37 districts.

A two tier system of local government in Scotland consisting of a regional level and a district level of authorities independently elected and having their own range of functions and their own means of raising finance but working closely together in many spheres, is the main recommendation of the Commission. It also proposes that provision should be made for 'neighbourhood' community councils which would not be local

authorities proper but would complement the local government structure.

It is proposed that the seven regional authorities (first tier) should be responsible for the major services i.e. the major planning and related services (including industrial development transport and roads water sewerage redevelopment new towns control of the countryside and tourism) the personal social services (education social work and health) housing the protective services (police fire and civil defence) and the impersonal services (such as refuse disposal coast protection weights and measures and consumer protection registration of births deaths and marriages and registration of electors).

For the second tier a majority of the Commission expressed a clear preference for the shire level as representative of communities quite wide in area and relatively self contained. At this level it recommends the creation of 37 district authorities with responsibility for local planning and related services building control housing improvement and ancillary housing functions local aspects of civil defence parks and recreation (concurrently with the regional authorities) libraries environmental health services and the administration of justice.

The Commission proposed that council elections should take place every four years with elections to district and regional authorities staggered so that an election would be held every two years that there should be one council member for each electoral division at the regional and district levels that councillors should be paid a salary.

As in England there were notes of dissent mainly from Miss H. Anderson M.P. (Conservative) and Mr. Russell Johnson M.P. (Liberal). These included: (i) all planning should be the responsibility of regional councils thereby enabling the district councils to be smaller more numerous (101 in place of 37) and closer to the public. (ii) Orkney Shetland and Western Isles should each become all purpose authorities on the ground that geographically they are distinct and different from the rest of Scotland. (iii) Argyll should be included in the West Region and not the Highlands.

Government Proposals—The Government's proposals for Scotland were published in a White Paper *Reform of Local Government in Scotland* (Cmd 4583). Broadly it accepts the structure of regional and district authorities recommended by the Commission. A further region governing the Borders has been added so that there will be 8 in all and in order to reduce the size of some of the districts in the more remote areas the Government proposes to increase the number from 37 to 49. The Isles of Orkney and Shetland will become virtually all purpose authorities.

The other important difference is that the district authorities are to be given additional functions in particular in relation to housing thereby unifying responsibility for the building management and improvement of housing.

The proposed timetable is a year behind that for England and Wales. Legislation will be introduced in the 1972-73 session, elections will be held in 1974 and the new authorities will be fully operational by 1975.

3 Wales

Local government in Wales was not included in the terms of reference of the Redcliffe Maud commission as plans for reform were already far advanced. However the Labour government had difficulty in finalising these plans producing two schemes in 1967 and 1970. The Conservative government published its proposals as a consultative document *The Reform of Local Government in Wales*. It proposes that as in England local government functions should be divided between 7 large counties and their districts of which there would be 36 in all. The major differences between this structure and that proposed by the Labour government are in South East Wales where unitary authorities centred on Cardiff Swansea and Newport are replaced by a two-tier structure and in North Wales where an additional county is to be created. The timetable for the introduction of the new system is the same as that for England.

4 Northern Ireland

Northern Ireland is governed under the Government of Ireland Act 1920 which created the Northern Ireland Parliament at Stormont. The Act confers on Stormont extensive powers for regulating the affairs of Northern Ireland but excludes certain matters from its jurisdiction such as foreign relations and defence customs and excise and income tax which remain the responsibility of the United Kingdom Parliament. Because of these reserved powers 12 M.P.s continue to be returned by Northern Ireland constituencies to Westminster. Although in some respects this system is akin to a federal situation the United Kingdom Parliament retains power to suspend the Government of Ireland Act.

For those matters within the jurisdiction of the Northern Ireland Parliament the government of Northern Ireland exercises executive powers. The Queen is represented by a Governor.

Local Government—At present local government is exercised by 1 county borough council, 6 county councils, 9 non-county borough councils, 24 urban district councils, 26 rural district councils and 2 development commissions exercising municipal functions. Between 1966 and 1969 plans were agreed for reform of local government but events were overtaken by the disturbances in summer 1969 and the decision in October 1969 to transfer responsibility for housing from local government to a central housing authority. The Minister of Development appointed a Review Body which reported in June 1970. It proposed a two-tier structure similar to that recommended by the Wheatley Commission for Scotland. Stormont would be the regional authority with responsibility for education, personal social services, highways and traffic, with 26 elected district councils exercising more local functions.

THE COMMONWEALTH

The Commonwealth

The Commonwealth is a grouping of most of the successor states of the British Empire and is usually described following the terms of the Statute of Westminster 1931 as a free association. It consists at present of 31 independent sovereign states together with a number of dependencies, mostly small islands which are dependencies of Britain, Australia or New Zealand. Fiji and Tonga became member states of the Commonwealth in 1970 and Western Samoa was formally admitted in the same year. Successor states of the Empire which are not part of the Commonwealth include Burma, Eire, Sudan, South Africa and South Yemen (formerly the Federation of South Arabia).

The Nature of the Commonwealth

The Commonwealth is not a federation and has no central government, defence force or judiciary. It is a grouping of states which continues to be useful to members for a wide variety of reasons. It is the only major association of states which links countries of the developed and underdeveloped world. A web of technical associations, education exchanges and cultural and personal links holds it loosely together. Geopolitically its main segments are Britain and the three older dominions (Australia, New Zealand and Canada), South Asia (India, Pakistan, Ceylon) whose peoples account for most of the quarter of the world's population who live in Commonwealth countries, and those countries of former British Africa which have not left the Commonwealth.

The Sovereign and the Commonwealth

The Queen's legislative power in the parliaments of the Commonwealth is a formality—she reigns though she does not rule, but she provides the element of continuity in the administration. The Queen is therefore Queen of the United Kingdom, Canada, Australia, New Zealand, Ceylon, Jamaica,

Trinidad and Tobago, Sierra Leone, Malta, Barbados and Mauritius, all of whom owe her allegiance and she is the symbol of their free association in the Commonwealth. Those countries which are Republics (India, Pakistan, Ghana, Cyprus, Nigeria, Tanzania, Zambia, Malawi, Botswana, Uganda, Singapore, Kenya, Gambia and Guyana) with Presidents as Head of State, Malaysia, which has one of the Malay Rulers as Head of State, Lesotho, Swaziland and Tonga, which have their own monarchs, do not owe allegiance to the Queen. All members accept her as the symbol of the free association of member nations of the Commonwealth and as such Head of the Commonwealth.

The Colonies

As stated in the opening passage of this outline the United Kingdom in common with other members of the Commonwealth has certain dependencies which are described as The Colonies. But this is a loose term for the Colonies are not really all Colonies in the strict sense. What are loosely spoken of as Colonies are properly divided into Colonies, Protectorates, Protected States, Trust Territories etc.

Definitions—*Colony*—A territory belonging by settlement, conquest or annexation to the British Crown.

Protectorate—A territory not formally annexed but in respect of which by treaty grant usage, suzerainty and other lawful means Her Majesty has power and jurisdiction.

Protected State—A territory under a ruler which enjoys Her Majesty's protection over whose foreign affairs she exercises control but in respect of whose internal affairs she does not exercise jurisdiction.

Trust Territory—A territory administered by the United Kingdom Government under the trusteeship system of the United Nations.

Condominium—A territory over which responsibility is shared by two administering powers.

Leased Territories—This term applies only to that part of the mainland of China which was in 1898 leased to Great Britain for ninety-nine years and is administered by the Government of Hong Kong.

Associated State—A former colonial territory which has entered into a free and voluntary association with Britain to become self-governing in all matters except for external affairs and defence. The term applies to six of the East Caribbean islands—Antigua, St. Kitts, Nevis, Anguilla and the four Windward Islands of Dominica, St. Lucia, St. Vincent and Grenada. See also C6(2).

Responsibility of the British Government.

The British Government is responsible for the affairs of Colonies (properly called Crown Colonies) both internal and external and for their defence and their peoples are British subjects. Protectorates are governed in the same way as Colonies but have not been annexed. The peoples of Protectorates are not British subjects but British protected persons. In the case of an Associated State the British Government is responsible for defence and external relations though it may confer upon the Associated State's government authority to deal with specific matters of foreign affairs.

The future of some of the remaining dependencies of Britain is unclear. Many are so small that it is doubted whether they could ever be viable as independent states and indeed that doubt applies to some of the smaller states which have already achieved independence. In the case of British Honduras, independence has been delayed because of the political problem represented by the Guatemalan claim to the territory.

The Countries of the Commonwealth—At the end of the Gazetteer is a list of all the countries of the Commonwealth showing their land area.

and recent estimates of population. The list distinguishes between the sovereign members and the British dependent territories and classifies the latter according to the kind of dependency. Not all the British dependencies come exactly within the definition either of Colony or Protectorate since for historical reasons many come partly under one heading partly under another.

The Commonwealth Secretariat

This body was established in 1965 with head quarters in London. It acts as a central source of information for Commonwealth members and prepares the ground for Commonwealth meetings and functions. The Secretary General is Mr Arnold Smith, a former Canadian diplomat. As might have been expected the Secretariat has attempted only the most discreet initiatives in relation to major Commonwealth problems such as the Nigerian civil war, Rhodesian U D I and arms sales to South Africa.

Commonwealth Problems

Britain's attitude to Southern African questions has been for years and remains the principal issue dividing the Commonwealth. With the coming to power of a Conservative government which has announced the intention of resuming arms sales to South Africa, the focus has moved away from the continued existence of a rebel régime in Rhodesia to what African and Asian Commonwealth countries see as Britain's continued support for a régime of white domination in South Africa. Britain's support of the Nigerian federal military government in the Nigerian war also alienated some African Commonwealth states but with the end of that war in January 1970 criticism of Britain's attitude has faded.

There is also the long standing problem of the hostility between India and Pakistan but this has long since ceased to be regarded as an issue amenable to British or Commonwealth mediation.

British entry into the Common Market represents a particularly pressing problem for New Zealand and the West Indies because of their dependence on agricultural exports to Britain.

Finally British attitudes to immigration and particularly to the plight of East African Asians who hold British passports but are nevertheless barred from freely entering Britain have come in for extensive criticism in Asian and African Commonwealth countries.

Rebellion in Rhodesia.

The dissolution in December 1963 of the Federation of Rhodesia and Nyasaland led to the independence of Northern Rhodesia (as Zambia) and of Nyasaland (as Malawi) and left Southern Rhodesia, renamed Rhodesia as a self governing colony. Rhodesia's white minority Government pressed for complete independence. The Rhodesian Front under the Prime Ministership of both Mr Winston Field and Mr Ian Smith, had insisted that Rhodesia had an immediate right to independence based on (a) the fact that it had been self governing for forty years and (b) that this was morally if not indeed explicitly but privately promised by British Ministers when the Rhodesian Federation was broken up. The British Government, both under Conservative and Labour rule, specified only that while Rhodesia should move to independence like any other self governing dependency it should be under a constitution broadly acceptable to the people as a whole and should provide for a peaceful transition to majority rule. This principle was elaborated in a statement of five conditions set out in the following paragraph. It was not said by either party that independence could not be granted to Rhodesia until a government elected on a franchise wide enough to be described as a government 'of the majority' is actually in power. But that majority rule must be the precondition was asserted by the two Rhodesian African leaders (divided but both in prison) by the African States by the United Nations and by some Commonwealth countries.

Five Conditions for Independence of Rhodesia — In the protracted negotiations between Mr Smith and Mr Wilson to reach a settlement in 1965 the latter took his stand on the following five conditions —

- 1 a guarantee of unimpeded progress towards the majority rule already envisaged in the 1961 Constitution
- 2 a guarantee of no retrogressive amendments of the 1961 Constitution
- 3 an immediate improvement in the political status of the African population
- 4 progress towards the elimination of racial discrimination and
- 5 the overriding requirement that Britain must be satisfied that any proposed basis for independence would be acceptable to the Rhodesian population as a whole

The British Government offered to co operate in a crash programme of education for Africans to fit them to take an effective share in the economic and political life of the country within the span of possibly a decade.

Unilateral Declaration of Independence — The long pressure for independence from 1963 to 1965 reached its climax on 11 November 1965 when Mr Ian Smith declared the independence of Rhodesia and the British Government were confronted by an act of rebellion. (U D I became known as I D I the illegal Declaration). The rebels protested their loyalty to the Sovereign whose commands however they were repudiating. African opinion was outraged and among the countries which broke off relations with Britain were two Commonwealth countries (Ghana and Tanzania), Mauritania, Guinea, Mali, the Sudan, Algeria and the Congo (Brazzaville). Britain ruled out from the start the use of force but Mr Wilson embarked on a policy of graduated economic sanctions including an oil embargo, the objective being the emergence under economic hardship of a liberal alternative to the Smith régime. The United Nations took the view that the 1961 constitution had broken down and that the decrees signed upon I D I amounted to the destruction of all safeguards for the rule of law and for human rights in the 1961 constitution and earlier legislation.

There are many aspects of the complex position in Rhodesia and several interpretations can be given. But one central fact must be stated simply: nearly five million Africans remain subordinate to 230 000 whites. The implications of the rebellion go far beyond Rhodesia. It has exacerbated the whole problem of race division in Africa. As such it has aroused strong feelings in black African countries and has strained the Commonwealth (on the multi racial character of which Britain has set such store). The rebellion exacerbates in particular the threatening confrontation between black African countries and South Africa and Portugal.

Commonwealth Conference 1966 and Rhodesia.

—At the Conference of September 1966 it was decided to give the Rhodesian Front régime a final chance of a negotiated settlement with Britain. If the offer were rejected Britain undertook to sponsor jointly mandatory sanctions at the UN, withdraw all previous proposals for a constitutional settlement and not grant independence before majority rule was achieved. The final offers by Britain had to be accepted before a fixed date.

It was agreed that the British Government would not recommend to Parliament any constitutional settlement which did not conform with six principles. These six principles were the five conditions for independence set out in an earlier paragraph together with sixth namely, no oppression of the majority by the minority or of the minority by the majority.

The Ride on the "Tiger" — After secret talks about talks between officials during the summer of 1966 Mr Wilson and Mr Smith had talks on 2 December on board H.M.S. *Tiger* off Gibraltar.

and prepared a working document which the Rhodesian Cabinet rejected three days later and on the 16th the UN Security Council voted on a British resolution for mandatory sanctions including oil.

The "Fearless" Talks—Mr Wilson and Mr Smith met on HMS *Fearless* in Gibraltar harbour on 9 October 1968 in yet another attempt to settle the dispute. But the talks ended on the 13th with disagreement on the fundamental issues still remaining. On 18 November the proposals based on the *Fearless* talks were rejected by Rhodesia. The white minority in the crisis affecting their country had found themselves unable to give the African majority reasonable prospects of education, jobs, political and civil rights. It was clear that what Mr Smith objected to was majority rule in Rhodesia at any time. In the House of Commons debate of 22 October 1968 the Prime Minister emphasised that the limit of what Britain could offer to reach a settlement with the illegal régime in Rhodesia had been reached.

Commonwealth Conference 1969

During the discussions at the Commonwealth Prime Ministers Conference held in London in January 1969 Britain was criticised for abandoning the principle of no independence before majority rule (NIBMAR) in putting forward to Mr Smith the *Fearless* proposals. The majority view was that these proposals should be withdrawn. But Mr Wilson could not accept that view. The *Fearless* terms were still on offer to Rhodesia. He considered that it would be right if it proved possible to give the people of Rhodesia as a whole an opportunity to decide for themselves whether or not they wished for a settlement which would be fully consistent with the Six Principles laid down by successive British governments. Any such settlement would need to be clearly shown to be the wish of the Rhodesian people as a whole. If that took place he would consult his Commonwealth colleagues about the NIBMAR commitment. He emphasised however that a settlement based on the Six Principles would not be genuine if it were shown that there could be no genuine test of its acceptability in present circumstances in Rhodesia.

New Constitution and Republican Form of Government

A referendum held in Rhodesia in June 1969 supported the illegal régime's proposed new constitution and republican form of government. It was opposed by the two African opposition parties the Centre Party Dr Palley the Independent M.P. the former GOC of the Rhodesian Army Lord Malvern and Sir Roy Welensky both former Prime Ministers of the Central African Federation business and trade union organisations and by the Christian churches except the Dutch Reformed church. On the other hand the Rhodesian Conservative Association condemned the proposals for not going far enough. Despite this opposition both proposals received large majorities viz

for a republic	Yes	61 130
	No	14 372
for the new constitution	Yes	54 724
	No	20 776

Of the electorate of 81 000 Europeans and 6 645 Africans some 75 500 cast their votes.

The new constitution follows in most respects the régime's constitutional proposals of May 1969 but additionally lays down that the Head of State shall be a President. The legislature would consist of a Senate (containing 10 European 10 African chiefs paid by the Government and 3 appointed members irrespective of race) and a lower House (50 Europeans 8 chiefs and 8 elected African members). The composition of the Senate is of special importance as the Declaration of Rights embodied in the régime's constitution would not be subject to jurisdiction in the courts; it would be for the Senate only to decide whether any particular piece of legislation contravened that declaration of rights.

Speaking in the House of Commons on 16 October 1969 the British Foreign and Commonwealth Secretary said such a constitution giving exceptional voting rights to a particular section of the community by virtue of wealth or education could be justified—if it could be justified in any circumstances—only if the régime which promulgated it made it overwhelmingly clear that it was giving the less privileged community every possible opportunity to improve its education to become more prosperous. But he continued ten times as much was at present spent on the education of a European child as on the education of an African child and while about 11 per cent of European children moved from primary to secondary schools only 1 per cent of Africans did so. As for the ownership of land the 230 000 Europeans would own rather more land than the 4 800 000 Africans. If the African happened to advance to the position where he might increase his wealth and voting rights in a town then we find that the redefinition of areas in the town is such as to operate solidly to the disadvantage of the African who seeks either to be a shopkeeper or a professional man. It was a constitution which at the very best and on the most favourable interpretation nobody could say is not really racial; it is related to education and income and at the same time makes it impossible for the less privileged race to advance in education and income.

The Opposition spokesman on Foreign and Commonwealth affairs in the House of Commons supported the Foreign and Commonwealth Secretary in declaring that Britain could not be a party to Mr Smith's proposed constitution for Rhodesia if it were adopted and that there would have to be a change of attitude in Salisbury if there were to be a negotiated settlement. *The Times* in its leader of 18 June 1969 said the real issue in Rhodesia is an illiberal constitution wholly alien to British traditions—illiberal not just because it repudiates any eventual majority rule and all the six principles, but because in its provisions it clearly opens the door to the type of administrative tyranny and police power that characterise the South African system.

Sir Humphrey Gibbs announced his resignation as Governor on 24 June 1969 and Rhodesia House in London was closed the same day. On 2 March 1970 the illegal régime declared itself a republic.

Talks about Talks

The Conservative government came to power committed to make one last try at reaching a settlement with Rhodesia. Mr Heath said in September 1970 that the government wanted to find a sensible and just solution to the Rhodesian problem. Shortly afterwards Mr Smith told a British TV team that he hoped Rhodesia would never degenerate to the system of one man one vote. The fifth anniversary of U.D.I. was celebrated with a military parade and fly past. It appears that neither Britain nor the Rhodesian régime believes there is any real chance of success. Sir Alec Douglas Home the Foreign Secretary told parliament in November 1970 that talks about talks had begun.

Arms Sales to South Africa

The incoming Labour government in November 1964 announced that it would honour a UN embargo on arms sales to South Africa although weapons already ordered by that country would be delivered. From that time until the Conservative general election victory of 1970 no arms other than these were supplied (with some small exceptions) and South Africa made a series of protests that Britain had violated the terms of the Simons town Agreement. The agreement has to do with British-South African naval co-operation in the event of war. The Conservative party in opposition however made it clear that it would wish in power to sell arms to South Africa for external defence.

Opposition to the resumption of arms sales built up quickly after it became clear that the Conservative government intended to lift the ban on sales. Tanzania in July 1970 said that she would withdraw from the Commonwealth if sales were re-

sumed. Later Tanzania, Zambia and Uganda announced they would follow a common course of action and in December President Obote of Uganda made it clear that for Uganda this would also mean withdrawal from the Commonwealth. In July Sir Alec Douglas Home the new Foreign Secretary had told the Commons that a final decision would be postponed until after talks with some Commonwealth countries and with South Africa itself. The prime ministers of both Canada and India wrote personal letters to Mr Heath asking him to reconsider his planned policy and the United States too indicated that she was strongly opposed.

Mr Wilson said in September 1970 that Labour would in office repudiate any arms deal with South Africa. President Julius Nyerere of Tanzania had talks with Mr Heath in October and President Kenneth Kaunda of Zambia met the British prime minister a few weeks later. President Kaunda at that time suggested that rather than withdrawing from the Commonwealth his country would argue for Britain's expulsion should arms sales be resumed.

Commonwealth Conference 1971

The Commonwealth Prime Ministers meeting in Singapore in January 1971 was dominated by the question of arms sales to South Africa. Britain maintained that she was entitled to sell arms under the agreement which allows the British navy to use the base at Simonstown. Opposition from the black African states hardened during a bitter debate over a document which President Kaunda of Zambia presented to the conference in which he attempted to define the general attitude of Commonwealth members to the major issues of our time including racial prejudice and discrimination. Mr Heath would not agree to the phrase in this declaration of principles which read: 'No country will afford to régimes which practise racial discrimination assistance which directly contributes to the pursuit or consolidation of this evil policy because it conflicted with his idea that Britain must be free to determine her own policies and he argued that the Commonwealth was bound by nothing save ties of friendship. A face saving compromise was reached by the insertion of the words 'in its own judgment (between which and directly)'. Mr Heath agreed also to the setting up of an eight nation study group to consider the security of the strategic sea routes in the Indian Ocean. The group was due to meet in London in mid 1971. However in February the British government decided that it was legally bound to supply helicopters and spare parts to the South African government under the Simonstown Agreement. Thus the purpose of the study group disintegrated and several members withdrew as a protest. The bitterness of the conference over Britain's attitude to arms sales to South Africa has led several observers to doubt whether ever again there will be a similar gathering of Commonwealth prime ministers.

Australia, New Zealand and South East Asia

The new Conservative government announced in October 1970 that Britain would maintain a small military force in Malaysia and Singapore thus reversing the previous government's policy of a complete withdrawal east of Suez by the end of 1971. The British units—some infantry battalion, a few helicopters and maritime reconnaissance aircraft and some frigates and destroyers—will be part of a five nation force also including units from Singapore, Malaysia, Australia and New Zealand. Talks to define the arrangements for this proposed defence grouping were due to be held early in 1971. Numerous problems face the new grouping, one related to the fact that Mr John Gorton, once Australian prime minister, had refused to commit his country to aid Malaysia in her dispute with the Philippines over the status of Sabah. The principal potential threat facing Malaysia and Singapore is internal Communist subversion and there may be fears that Australian, British and New Zealand involvement could lead to a Vietnam type situation. There are also worries that the British and Australian troops might be

drawn into communal war between Malays and Chinese.

The clear involvement of Australia and New Zealand in South East Asia since the war has had its effect on their domestic affairs. In the early and middle sixties both Australian and New Zealand opinion was broadly in agreement with their governments' support for Malaysian and Singapore's efforts to consolidate their new nationhood and also for the support given by both governments to the South Vietnamese government including troops. As a result the Liberal/Country coalition in Australia and the National Party in New Zealand were able to consolidate and extend their power at the expense of the Labour Party in each country. During 1968 and 1969 Labour opposition to participation in the Vietnam war increased in strength, this feeling combined with new leadership in particular a Labour party and in Australia in particular a feeling that the ruling party had lost its steam and had a long run combined to make it appear that in 1969 there would be a change of government in each country. But this did not happen. In New Zealand the National Party just maintained its lead and in Australia the Liberal/Country coalition obtained 66 seats against 59 for Labour. Labour polled just under 47 per cent of the total vote and it would appear that the government was saved partly by the second preference votes cast for the Democratic Labour Party and partly by its ability to win a majority of marginal seats. Following a crisis in the Liberal party in March 1971 the two top ministers changed places. Mr William McMahon taking over the premiership and Mr Gorton the Defence portfolio. Elections are due to be held in 1972.

The greater participation in Asian affairs appears slowly to be moderating Australia's traditional immigration policies. Since 1945 some three million people have settled in the country of which almost half have had assisted passages. Over half have come from Britain and more than 100 000 from each of Italy, Greece, the Netherlands and Germany. Of greater interest perhaps is the fact that more than 50 000 have been admitted from Asian and African countries including 16 000 Chinese and Japanese.

Canada

The relationship between the English speaking and the French speaking communities remains Canada's principal political problem. The Quebec elections in the spring of 1970 which gave the Quebec Liberal Party committed to federalism a clear majority also saw the separatist Parti Quebecois take 26 per cent of the popular vote. Nevertheless the improving economic situation in the French speaking province and the security of the provincial Liberal government seemed to justify the hope that the separatist issue was on its way to cooling off. The kidnapping by the Front de Liberation du Quebec of a British trade commissioner and the Quebec minister of Labour, Mr Pierre Laporte, showed that some elements in the separatist movement had no intention of conceding ground gracefully. Mr Pierre Trudeau, the Canadian prime minister, invoked Canada's War Emergency Act declaring that a state of apprehended insurrection existed in the province. Shortly afterwards the corpse of Mr Laporte was discovered by police. Mr James Cross, the British trade commissioner, was later released by his captors. The general view was that the Quebec separatist movement had been seriously weakened by the kidnappings and the murder of Mr Laporte.

Conferences were held in 1968 and 1969 between the Federal Prime Minister and the ten Provincial Prime Ministers and committees have been set up covering the following subjects: official languages, fundamental rights, division of powers, reduction of regional disparities and the reform of the Senate (upper House). During 1969 the Official Languages Bill was enacted. The new Act provides for equality between the two languages at federal level in parliament and government in the issue of public instruments in the public services and courts. Bilingual districts could be established wherever the minority reached 10 per cent.

of the population and a Commission of Official Languages was to act as watchdog. At the same time care was taken to ensure that the federal civil service would not be closed to entrants able to speak English only.

THE UNITED NATIONS

Charter of the United Nations

The Charter of the United Nations was signed on June 26 1945. The purposes of the United Nations can be divided into four groups (security justice welfare and human rights) and the nations undertook to carry out four main duties (to settle disputes peacefully to refrain from treating or using force to assist in carrying out the Charter and not to assist an aggressor). The UN affirms faith in the human rights of all without distinction of race language sex or religion.

Membership of the United Nations

The UN had one hundred and twenty seven member countries in 1971. They were

Afghanistan	Kuwait
Albania	Laos
Algeria	Lebanon
Argentina	Lesotho
Australia	Liberia
Austria	Libya
Barbados	Luxembourg
Belgium	Malagasy Republic
Bolivia	Malta
Botswana	Malawi
Brazil	Malaysia
Bulgaria	Maldives Islands
Burma	Mali
Burundi	Mauritania
Byelorussian S S R	Mauritius
Cambodia	Mexico
Cameroun	Mongolia
Canada	Morocco
Central African Re	Nepal
public	Netherlands
Ceylon	New Zealand
Chad	Nicaragua
Chile	Niger
China (Taiwan)	Nigeria
Colombia	Norway
Congo (Brazzaville)	Pakistan
Congo (Kinshasa)	Panama
Costa Rica	Paraguay
Cuba	Philippines
Cyprus	Poland
Czechoslovakia	Portugal
Dahomey	Roumania
Denmark	Rwanda
Dominican Republic	Saudi Arabia
Ecuador	Senegal
El Salvador	Sierra Leone
Equatorial Guinea	Singapore
Ethiopia	Somalia
Fiji	South Africa
Finland	Spain
France	Sudan
Gabon	Swaziland
Gambia	Sweden
Ghana	Syria
Greece	Tanzania
Guatemala	Thailand
Guinea	Togo
Guyana	Trinidad and Tobago
Guinea	Tunisia
Haiti	Turkey
Honduras	Uganda
Hungary	Ukrainian S.S.R.
Iceland	United Arab Republic
India	U S S R
Indonesia	United Kingdom
Iran	United States
Iraq	Uruguay
Ireland	Venezuela
Israel	Vietnam Republic
Italy	Yemen
Ivory Coast	Yemen Southern
Jamaica	Yugoslavia
Japan	Zambia
Jordan	
Kenya	

The membership includes 29 members of Commonwealth countries representing one quarter of the world's population. The African group is numerically the strongest with a membership of 39 (excluding S Africa). Twelve member states are communist. The following countries are not members: China Switzerland East Germany West Germany North Korea South Korea North Vietnam South Vietnam Liechtenstein Monaco.

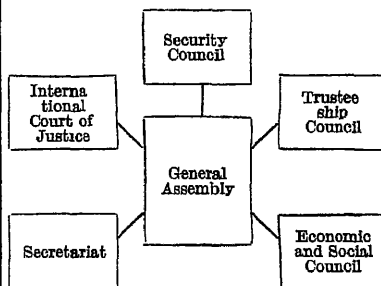

Major Organs of the UN

The UN has six major organs: (1) a General Assembly (2) a Security Council (3) an Economic and Social Council (4) a Trusteeship Council (5) an International Court of Justice and (6) a Secretariat. It is especially the inclusion of the third body on this list (with all the Commissions and specialised agencies which stem from it) which makes the UN more broad and balanced than the League of Nations.

General Assembly

The General Assembly occupies a central position in the structure of the UN. But its business is quite distinct from the Security Council. It meets once a year. The Assembly can consider the general principles of co-operation for peace and security and disarmament and regulation of armaments. It can discuss any question concerning peace and security brought before it. It makes recommendations but any question upon which action is necessary must be referred to the Security Council. The carrying out of its humanitarian work is the function of the Economic and Social Council (dealt with below) which it elects and supervises. Further the Assembly controls the purse.

Principal Organs of the United Nations.

The Security Council

The aims of the UN are wide—from feeding starving peoples to encouraging self government in backward areas—but it cannot advance towards the noble objectives set out in the Preambles unless peace is maintained. The principal organ to preserve peace and security is the Security Council. The size of the Security Council was enlarged from 11 to 15 with effect from January 1986. Five seats are permanently occupied by Great Britain the U S A the U S S R China and France. The China which is represented in the UN and on the Security Council is not however the Republic of China (or Communist China). It is the régime of Chiang kai Shek who occupies Formosa. The other seats are normally elected for two years by the General Assembly. The ten temporary members are: Argentina Belgium Italy Japan Somalia (retiring at end of 1972) and Burundi Nicaragua Poland Sierra Leone and Syria (retiring at the end of 1971). The Security Council sits continuously. It has two functions: (1) to promote the peaceful settlement of disputes and (2) to stop aggression. Under the Charter parties to a dispute have already promised not to use force to settle their quarrels peaceably and to refer their disputes to the Security Council if they really can.

not reach a peaceful settlement. On its side the Council can call on the parties to settle disputes peacefully; it can investigate any situation likely to cause a breach of the peace and at any stage it can recommend a solution.

The Veto

At this point we must deal with the veto which applies to substantive questions. The number of affirmative votes required for adopting decisions on substantive matters is 9 including the votes of the five permanent members. In other words if any one of the permanent members says 'No' to the use of force even after a full investigation the Council cannot use force to settle the dispute. Thus when it comes to imposing sanctions for a breach of the peace the assent is required of the Great Powers and one of them may of course be a party to the dispute. If the Great Powers imposed sanctions on each other it would mean a major war in which the present UN would disappear. Partly in order to overcome the difficulty of the veto the Assembly set up a Committee to remain in permanent session consisting of one representative of each member. It is known as the Little Assembly its formal title being the Interim Committee.

The Uniting for Peace Resolution 1950

The General Assembly had always been able to discuss matters of peace and security although it could not make recommendations about them if they were being considered by the Security Council. But in 1950 after the Korean crisis a new decision was taken by the General Assembly whereby if there were some threat or breach of the peace on which the Security Council was in deadlock the Assembly on a vote of seven members of the Security Council could consider it immediately and make a recommendation about it. This decision to which Russia and four other countries were opposed was called the Uniting for Peace resolution. By this resolution too the Assembly can be called together within twenty-four hours. It was the standing Interim Assembly which considered the Israeli-Egyptian dispute in November 1956.

The Economic and Social Council

The UN pledged themselves to a broad humanitarian policy of which the following are salient points to promote higher standards of living, full employment, the conditions of economic and social progress, solutions of international economic, social, health and other related problems, educational co-operation, universal respect for human rights and the fundamental freedoms for all. The main business of the Economic and Social Council is to carry out this broad policy. The size of the Council was increased from 18 to 27 with effect from January 1966. To tackle these huge problems the Council established a number of important commissions and bodies the principal being the following —

Regional Economic Commissions

Economic Commission for Europe (ECE)

Economic Commission for Asia and the Far East (ECAFE)

Economic Commission for Latin America (ECLA)

Economic Commission for Africa (ECA)

Functional Commissions

Disarmament

Statistics

Population

Social

Human Rights

Status of Women

Narcotic Drugs

Special Bodies

UN Children's Fund (UNICEF)

Commissioner for Refugees

Conference on Trade and Development (UNCTAD)

Industrial Development Organisation (UNIDO)

Intergovernmental Agencies (previously called Specialised Agencies) — The agencies are organisations established by intergovernmental agreements and their activities as a rule are co-ordinated by the Economic and Social Council. The list of the fifteen Agencies are given below.

International Atomic Energy Agency (IAEA)

International Labour Organisation (ILO)

Food and Agriculture Organisation (FAO)

UN Educational, Scientific and Cultural Organisation (UNESCO)

World Health Organisation (WHO)

World Bank (Bank)

International Finance Corporation (IFC)

International Monetary Fund (FUND)

International Development Association (IDA)

International Civil Aviation Organisation (ICAO)

Universal Postal Union (UPU)

International Telecommunication Union (ITU)

World Meteorological Organisation (WMO)

Inter Governmental Maritime Consultative Committee (IMCO)

General Agreement on Tariffs and Trade (GATT)

Several of these organisations were at work before the UN was set up. One such body is the ILO.

A Peace Force

Since its inception in 1945 the United Nations has been called on only four times for military action — in Korea (1950) in Egypt (1956) in the Congo (1960) and in Cyprus (1964). Korea was really an American containment action under the covering of the UN. In other operations the number of troops ranged from 6,000 to 20,000. Apart from military action the UN has sent observers or presences to various parts of the world mainly to the Middle and Far East to facilitate settlement of disputes. Thus to maintain a standby force of 20,000 men when it might be needed so rarely would be a waste, apart from problems of bases, control and equipment. Two ideas about the best kind of peace force hold the field. They are —

- (1) the earmarking of national military units and
- (2) a permanent multiracial force

The cogent arguments for a permanent UN Military Force can be studied in *United Nations Forces* by D. W. Bowett, pub. by Stevens in 1967.

A United Nations Success: Technical Assistance

That the United Nations is something more than a place of talk is proved by a glance at the history of its programme of Technical Assistance. The object of this aid is to help countries to develop their economic and political independence and since this must be a truly co-operative venture receiving countries must not only invite the experts but actively participate in projects they undertake both with money and with local personnel — even the poorest being encouraged to make a contribution. A major reform was made in 1966 by the simplification of the existing systems of capital and technical aid by the United Nations. The

two main channels of aid were fused—the UN Special Fund and the UN Technical Assistance Board—to become a single Council for a UN Development Programme (UNDP). See also Underdeveloped Economies Section G Part III.

Unicef

Of all the United Nations agencies Unicef has most caught public imagination. In the early years of the war the attempt began to make amends to children whose early years had been shattered by war and during the quarter century since Unicef has been bringing aid to millions all over Africa and Asia. Unicef does not draw directly on United Nations funds but voluntary help from Governments and individuals. There have been two developments of policy

- (1) a change in 1950 from post war relief work to programmes of help for mothers and children in developing countries and
- (2) from 1960 an emphasis on education and vocational training rather than pure survival projects

Human Rights

The 20th anniversary of the adoption and proclamation of the Universal Declaration of Human Rights by the General Assembly on 10 December 1948 was marked by the observance of the year 1968 as International Year for Human Rights. There seemed however in 1968 a good deal to deplore as well as to celebrate. There had been a good deal of thinking on the subject and over two decades numerous conventions had been drawn up. But there had unfortunately been a good deal of obstruction and non co operation and in 1968 the situation of slaves political prisoners and minorities of all kind was distressing. Let us take these two parts of the problem in turn—the resolution for improvement and the actuality

Declarations and Conventions on Human Rights

Every member of the UN endorsed the Universal Declaration of Human Rights. It marked the determination to prevent the recurrence of the genocide and brutality which occurred in the Second World War. Out of it sprang a Commission on Human Rights and numerous other Declarations and Conventions. Thus the European Convention on Human Rights prescribed that no one shall be subjected to torture or to inhuman or degrading treatment or punishment and there has been established a European Court on Human Rights. Among subsequent Declarations have been those on

- (1) Granting of Independence to Colonial Countries and Peoples
 - (2) Elimination of All Forms of Racial Discrimination.
- and among Conventions have been those on
- (3) Abolition of Slavery the Slave Trade and Institutions and Practices Similar to Slavery
 - (4) Abolition of Forced Labour
 - (5) Discrimination in respect of Employment and Occupation
 - (6) Equal remuneration of Men and Women Workers
 - (7) Freedom of Association and Protection of the Right to Organise
 - (8) Discrimination in Education.
 - (9) Prevention and Punishment of the Crime of Genocide
 - (10) Political Rights of Women.

Drafts have been prepared for Covenants or Conventions on

- (11) Civil and Political Rights, Economic Social and Cultural Rights
- (12) Elimination of All Forms of Religious Intolerance
- (13) Freedom of Information

But after conventions are adopted at UNO they need to be ratified thereafter signed thereafter nations need to take the necessary action to enable the provisions to be put into force and finally to put them into force. These are the stages between declaration of intent and fulfilment. As U Thant has said: 'The mere adoption of various covenants and international agreements is not enough by itself. We need therefore to temper enthusiasm for intentions with critical regard for what is actually happening.'

The Persistence of Slavery

Slavery persists today in five forms defined in the UN Supplementary Convention on the Abolition of Slavery (1956) namely chattel slavery serfdom debt bondage sham adoption and servile forms of marriage. The Anti Slavery Society (for the Protection of Human Rights) stated in 1967 that it has recent information of the existence of one or more of these forms of slavery in thirty countries in the free world. Apart from servile marriage the other forms probably embrace between one or two million people. This exploitation can only be fought when governments legislate against it and their officials and people uphold the law. To encourage them to do so is the main function of the Anti Slavery Society. Founded so far back as 1823 it is the principal organisation in the world working to end slavery and it has consultative status at the Economic and Social Council at UNO. It supports the setting up of machinery to implement the slavery conventions called for in October 1967 by the Int Commission on Prevention of discrimination and Protection of Minorities. Besides the eradication of slavery in all its forms the Society's aims include the abolition of labour systems resembling slavery and the protection and advancement of aboriginal and primitive peoples. The address of the Anti Slavery Society is Denison House Vauxhall Bridge Road S W 1.

The Anatomy of the United Nations

Some ironical changes have taken place in the UN since its inception. At the outset the Security Council was built as the organ through which the Great Powers would together discharge their collective responsibility as policemen. They were the superior powers. They had the authority and the means to act as the big policemen to keep others in order. But this assumed that the big five permanent members would agree and act in concert. This is just what they did not do. As a result in 1950 by Anglo Saxon device the General Assembly was mobilised to ensure action when action was vetoed in the Security Council. But over the last decade the Assembly has grown both in numbers and in the independence of its views. It is not at all as interested in the conflict with Communism as those assumed who vested it with additional power. It is more interested in colonialism. So those who gave the Assembly this additional strength would like to reverse the position. But here we confront another difficulty. China one must expect (and hope) will join the Security Council. That will make the unity in that body which is vitally necessary for peacekeeping even more difficult. The prospect of Communist China becoming a member of the UN advanced in November 1970 when a resolution to admit Peking and expel Formosa secured a majority of two votes. This was the first time Communist China had won a majority for admission. But the effect of the American backed formula declaring the issue an important question means that Peking's admission requires a two thirds majority. There were signs at the Assembly's 25th session that the important question formula may not for much longer win a majority of votes. If the formula were rejected Peking's admission would be conditional only on a simple majority.

The General Assembly's 25th Session

This centenary session which was held in New York in the autumn of 1970 attracted numerous heads of state but the achievements of the session

were as expected limited. The most important shift was in the vote over the admission of Communist China already mentioned.

The 1970s were declared a Second UN Development Decade under which the developed countries are to be asked to contribute 1 per cent of their gross national product to overseas aid and a corps of UN volunteers on Peace Corps lines is to be set up. Few experts expect that more than a handful of the developed nations will actually make the recommended diversion of resources to overseas aid.

A draft treaty banning the use of the seabed for weapons of mass destruction was approved by the Assembly. The draft treaty has however been widely criticised on the grounds that it bans something which none of the nuclear powers actually want to do. Neither of the two nuclear powers has any plans for fixed nuclear weapons on the seabed considering submarine launched missiles technically and strategically preferable.

The African group put forward numerous resolutions condemning apartheid and white minority rule in South Africa, Rhodesia and the Portuguese colonies. Condemnation of apartheid was one of the points in the 20th anniversary declaration. The existing arms embargo in South Africa was strengthened. The British prime minister Mr Edward Heath managed however to avoid all mention of his government's plans to sell arms to South Africa in his speeches to the General Assembly. The French however announced a ban on the sale of certain categories of weapons to South Africa.

The Assembly also in various resolutions put pressure on Israel to resume unconditionally the indirect negotiations with the Arab countries which earlier in 1970 had been broken off by Israel on the grounds that the Egyptians had violated the Suez standstill by deploying missiles near the Suez Canal.

WESTERN EUROPEAN ORGANISATIONS

1 Introduction

This outline is an attempt to explain the various organisations through which European countries are trying to co-operate. The destruction in Europe in the Second World War emphasised the need for greater union both for recovery and for defence. A bewildering array of organisations has sprung up. They differ in form in function and in membership. Some overlap in function. Some are much less effective than others. The edifice is not moreover built on a single harmonious plan. Beneath the edifice are two different kinds of foundations that is to say two rival theories. These two theories (the federalist and the functionalist) are explained as the story unfolds. The story traces four main streams—the military, the political, the economic and the scientific and technological—and describes the bodies which evolved in each stream.

Historic Origin of European Unity

Sully the famous Minister of Henry IV King of France outlined in 1683 a proposal for achieving European unity and putting an end to war in Europe. He called it the Grand Design. It was revived in modern dress by Monsieur Brandt the French Prime Minister in 1929. During the War (1943) the concept of a United Europe which should be created after victory was won was outlined by Sir Winston Churchill and he returned to the subject in his famous speech at Zurich University in 1946.

Two Starting Points: European Recovery Programme and the Brussels Treaty

There were two main sources of the present numerous European bodies. The first was the European Recovery Programme in 1947 (ERP) and the second was the Brussels Treaty of 1948.

The European Recovery Plan was popularly known as the Marshall Plan as it was the result

of the invitation made in 1947 by Mr Marshall (then U.S. Secretary of State) to the European countries to draft a programme to put Europe on her feet economically. The U.S.A. was ready to give this aid and it was in its own interest as well to do so if the countries concerned would agree on co-operation and plan their needs. In March 1948 the countries concerned created the Organisation for European Economic Co-operation (OEEC) to administer the programme of aid. This body was replaced by the Organisation for European Co-operation and Development in 1961.

The Brussels Treaty, 1948 was the other main source of the West European organisations. In March 1948 Britain, France and the Benelux countries (Belgium, Holland and Luxembourg) agreed at Brussels to pursue a common policy on economic, political and military collaboration and to promote a better understanding of the principles which form the basis of the common civilisation of Western Europe. It also provided for the creation of a Consultative Council. This Council when formed was the Council of Europe and it is described below together with an account of all the organisations which stemmed from the Treaty. Italy and the German Federal Republic joined the Brussels Treaty Organisation in May 1955 which then became the Western European Union.

2 Military Organisations

The Brussels Treaty and the Western Union Defence Organisation

As we have seen under the Brussels Treaty so far back as 1948 the five Western Powers concerned pledged themselves to military collaboration and in the same year they formed the Western Union Defence Organisation. At that time policy was being framed by a fear of a revival of German aggression. But in time this fear was replaced by distrust of the Soviet Union. There were two developments. In the course of seven years the Western Union Defence Organisation was transformed by the inclusion of the German Federal Republic itself and of Italy into a larger body called the Western European Union. How this change came about is described in the following paragraphs which tell the story of the creation of the new Federal Republic of Germany, the proposal for a European Defence Community (which did not materialise) and the eventual emergence of Western European Union (in 1955). The second sequel of a military character of the Brussels Treaty was the creation of the North Atlantic Treaty Organisation (NATO). Whereas WEU is a regional organisation, NATO has an even larger range as its members include Canada and the U.S.A. An account of NATO follows the story to which we now turn of the emergence of the new German Republic and its eventual incorporation in WEU.

Government of Germany after the War

As a result of Germany's unconditional surrender on June 5, 1945, all power in Germany was transferred to the Governments of the four principal Allies. By decisions at Potsdam in 1945 that power was exercised by the Commanders in Chief of the U.S.A., the United Kingdom, the Soviet Union and France, each being responsible in his own zone of occupation. On matters affecting Germany as a whole, the four would be jointly responsible as members of the Control Council. Berlin was divided into four sectors of occupation.

The London Conference 1947 of the four Foreign Ministers concerned failed to agree on a joint German settlement. Unfortunately the effect was to set in motion political and economic developments which were speedily to make Germany the battleground of the conflict of ideas between Soviet Russia and the Western Powers. The Allied Control Council could no longer function efficiently and by the end of 1948 four Power

rule had virtually collapsed and the partition of Germany was complete. A federal Parliament and Government were formed in Western Germany. The Soviet zone prepared a rival form of Government for East Germany.

Western Germany's New Status—In May 1952 the German problem acquired a new complexion when the so-called Contractual Agreements were signed by the three Allied Powers and Western Germany at Bonn. These Agreements did not form a Peace Treaty but they attempted to define how W. Germany and the three Allied Governments should work together. Sovereignty was to be restored to Germany and she was to enter a military alliance with France. Indeed a Treaty called the European Defence Treaty was drawn up between the four Powers with Italy and the Benelux countries which was to fit German Armed Forces into a Western European system. But this system called the European Defence Community never came to fruition as such, owing to the refusal of France to ratify the Treaty in 1954.

Collapse of EDC—With the collapse of EDC there was a halt to the idea of a Political Community designed to embrace both the proposed EDC and the existing European Coal and Steel Community. It was logical that these two Communities formed by the same countries should have separate institutions but should take their place within a single political community.

The London Nine Power Conference and the Paris Agreements 1954—Nine Powers met in London to devise a substitute for EDC. They were Belgium, Canada, France, the German Federal Republic, Italy, Luxembourg, Netherlands, United Kingdom and the U.S.A. The Conference considered how to assure full association of the German Federal Republic with the West and the German defence contribution. All the decisions which were reached formed part of one general settlement and these were embodied in agreements signed shortly afterwards in Paris. These decisions included the following—

1. The occupation of W. Germany by Great Britain, the U.S.A. and France should end.
2. The German Federal Republic and Italy should join the Brussels Treaty Organisation.
3. The W. German Republic was admitted to the North Atlantic Treaty Organisation (NATO).

Western European Union

These agreements took effect on May 5 1955 when the occupation regime in Western Germany ended and the Republic attained full sovereignty and independence. At the same time the Republic became a member of the Western European Union (the expanded Brussels Treaty Organisation) which came into formal being on May 5 1955 and also of NATO to which we now turn. The WEU includes the EEC countries and Britain and is therefore a useful forum for consultation and discussion. The activities of the WEU were boycotted by France in 1969.

The North Atlantic Treaty 1949

The founder members of this Pact (which widened the scope of the Brussels Treaty) were Great Britain, the U.S.A., Canada, France, Holland, Belgium and Luxembourg. The parties agreed that an armed attack against one or more of them in Europe or North America shall be considered an attack against them all and consequently they agreed that if such an armed attack occurs each of them in exercise of the right of individual or collective self defence recognised by the Charter of the UN will assist the party so attacked.

NATO Policies and Plans

The NATO Ministerial Council met twice in 1970. NATO policies still continue to be based sometimes rather uneasily on the twin concepts of defence and détente. The move towards some kind of détente with the East continued when the May ministerial meeting agreed to a sounding out of Warsaw Pact members on the possibility of a European security conference and mutual force reductions. At the ministerial meeting in December 1970 NATO defined its attitudes more precisely, agreeing that preparatory talks on East-West security should be held once there was a settlement in Berlin. Such talks would also be conditional on the meeting decided on evidence of progress in other current talks meaning the Strategic Arms Limitation Talks between the Soviet Union and the U.S.A. and the talks between West and East Germany. The Soviet Union anxious for a European security conference removed one obstacle during 1970 by indicating that it would not oppose American and Canadian participation in any European security talks.

Force levels continue to be a major worry for the Alliance whose conventional strength is so inferior to that of the Soviet bloc as to lead to a dangerous and sometimes not very credible reliance on nuclear weapons. One long standing fear of the European members was that the U.S. would gradually reduce its forces in Europe. This was assuaged in 1970 when President Nixon pledged the U.S. to maintain and improve U.S. forces in Europe. The *quid pro quo* for this commitment emerged at the December ministerial meeting in the form of a West German plan for European members to increase their NATO budgets over the next five years by \$375 million. Britain however has so far refused to commit itself to an increased financial contribution maintaining that her contribution of additional units during 1970 is an adequate substitute.

NATO which up to the time of the Soviet invasion of Czechoslovakia was evolving towards peace policies concerned with economic and technical co-operation with the East and joint attempts to tackle such all Europe problems as pollution has since then reverted strongly to its military role. The basic problems of the future are of course no longer seen as related to a possible massive Soviet attack but to breakdowns or uprisings within Eastern Europe. The fear is that such internal struggles could spill over into more general war. If the West wishes to influence Soviet policy within Communist and neutral Europe the conventional strength of NATO is of more importance than the nuclear deterrent.

3 Political and Economic Organisations

The European Economic Community

The EEC was formed in 1958 growing out of the European Coal and Steel Community, a supranational body set up in 1950 for the co-ordination of coal and steel production in West Germany, Belgium, Holland, Luxembourg, France and Italy. It has been a notable economic success. The 1970s have seen it complete a common agricultural policy, meet its goals on internal and external tariffs (by 1968) and take the first steps towards a common monetary policy. The EEC is unquestionably the strongest and most significant of all European organisations and the only one which provides any sort of basis for West European unity. Other bodies such as the Council of Europe and the European Free Trade Area (EFTA) as well as regional associations like the Nordic Council and the Benelux Economic Union now stand outside the mainstream of European political and economic development. Others still like the Organisation for Economic Co-operation and Development the successor to the Organisation for European Economic Co-operation (OEEC) have so expanded their terms of reference as to have ceased to be solely European organisations. See also C39-40.

The Council of Europe

This body was formed in 1949 and now has 18 member nations. The agreement of 1949 set up a Committee of Ministers and a Consultative

Assembly forming together a Council of Europe Headquarters are at Strasbourg

The Consultative Assembly is the deliberative organ of the Council and is empowered to debate and make recommendations upon any matter which (i) is referred to it by the Committee of Ministers with a request for its opinion or (ii) has been approved by the Committee. The Assembly consists of 147 members elected by their national parliaments. Originally the members were seated in alphabetical order of names today they sit grouped in political parties irrespective of their nationality. The Committee of Ministers is the Council's executive organ and is not responsible to the Assembly but merely reports to it.

Future Role of the Council—The Council remains in doubt about its future role particularly if Britain and other candidate nations for Common Market entry are admitted. Its condemnation of Greece in 1970 demonstrated that it has a claim to be the collective voice of European democratic opinion. But criticisms that it is no more than a talk shop and that the EEC and even NATO can better discharge many of the tasks it has attempted continue. The best reply to such criticisms has been that there remains a wide area outside the present scope of NATO and the EEC—an area encompassing for example human rights the law social policy education pollution—where the Council can play a key co-ordinating role. The Council has a reasonably impressive record in some of these areas. Examples are its encouragement of reciprocal social service arrangements between European countries the co-ordination of medical standards and its general work on the harmonisation of law.

A European Free Trade Area

When the Six were discussing the Common Market the British Government declared (1956) that they would consider joining a free trade area in Europe. Although she would not join the Common Market scheme itself she would consider sharing in the stage by stage reduction of inter-European tariffs on all non-agricultural goods. They would not attempt (unlike the Six) to standardise their own tariff walls in relation to the world outside the European free trade area. Such a free-trade area would be independently controlled with permanent co-ordination with EEC. In November 1958 France rejected the British proposals for linking the six European common market nations with the eleven other OEEC countries in a free trade area. It appeared to the French impossible to establish a free trade area between the six treaty powers and the other eleven OEEC countries without a single customs tariff between all of them and the outside world and without measures of harmonisation in the economic and social sphere.

The European Free Trade Association

Thereupon seven countries outside the area of the Six formed a European Free Trade Association. They were Great Britain Austria Denmark Norway Portugal Sweden and Switzerland and they agreed upon a plan at Stockholm in November 1959. Inside the free trade area comprising these seven countries it was contemplated that there would eventually be no internal tariffs or quotas but member states would retain separate external systems. The Seven upon the foundation of their Association immediately offered friendly co-operation to the existing Common Market. When EFTA was formed its member nations confidently expected that the EEC would soon see the error of its ways and agree to the creation of a vast European free trade zone. In the event EFTA members saw their error first with three members of the original seven starting negotiations with the EEC in 1961. The same three once again began negotiations with the EEC in June 1970. If Britain Denmark Norway and Ireland (not a member of EFTA) do succeed in joining the Common Market EFTA can be expected to swiftly wither away. In late 1970 the EEC opened negotiations with Portugal Iceland and Finland in an attempt to find arrangements which would soften the blow of British entry. Sweden Switzerland and Austria are also working

for some form of association with EEC (Finland is an associate member of EFTA and Iceland a recently joined full member).

The Organisation for European Economic Co-operation (OEEC)

We now turn to the third stream the economic. We have seen that OEEC was created to administer American (Marshall) aid. But it needed also to re-create a sound European economy. The allocation of aid continued until 1952 but the practice of mutual consultation on economic matters continued in order to carry out long term programmes. Owing to the nature of its original task of distributing Marshall Aid the U.S.A. and Canada became associate members of the Organisation. In 1961 these two countries formed with members of OEEC the Organisation for Economic Co-operation which replaced OEEC and is described below.

Organisation for Economic Co-operation and Development

This body has taken the place of OEEC. Canada and the United States who were associated members of OEEC joined with the eighteen member countries of that body to set up OECD. The convention was signed in Paris in December 1960 and the new body came into existence in the autumn of 1961. Thus Canada and the U.S.A. join in facing the broader objectives and the new tasks of today namely to achieve in Europe the highest sustainable economic growth employment and standard of living to contribute to economic development and to expand world trade on a multilateral and non-discriminatory basis in accordance with international obligations. The scope of OECD has been further widened by the accession to membership of Japan.

Economic Commission of Europe

ECE was the first of the great regional commissions to be set up by UNO. It was created in 1947 to concert action for the economic reconstruction of Europe and it was hoped to strengthen economic co-operation between all European members of UNO. Russia and some of the Communist Eastern European countries are members of ECE and it is the only European organisation where the Western bloc and Soviet powers can meet for discussion and action.

4. The Development of the Common Market

The Treaty of Rome 1958 which had established the European Economic Community defined (in Articles 2 and 3) the principles and objects for which the Community is to work. Those articles specify in detail the steps for creating a Common Market for approximating the economic policies of member States the promotion of harmonious development of economic activities and raising the standard of living. But the sum of closer relations between its member States is stated without elaboration. It is into this gap that speculation is poured. No limit is set in the Treaty to the process of integration on the other hand there is no commitment to join a Federation of Europe. While member States commit themselves to a common policy on a number of economic issues there will be co-ordination of national policies designed to take account of the needs of the rest of the Community.

The Organs of EEC

The machinery of government of the European Economic Community (into which is now integrated the machinery for ECSC and Euratom) consists of

- 1 The Council
- 2 The Commission
- 3 The Court
- 4 The Parliament or Assembly
- 5 The Economic and Social Committee (for the Common Market and Euratom) and
- 6 The Consultative Committee (for ECSC)
- 7 The Ambassadors of the member Governments

The meetings of Ambassadors form unofficial permanent liaison between Council and Commission. Let us examine the chief official organs.

The Council issues regulations and decisions which are upon issue binding in law on all member States. It consists of one member from each member State (normally a Cabinet Minister). Decisions require either unanimity or a qualified majority weighted as follows.

France	4 votes
Germany	
Italy	
Belgium	2 votes
Holland	
Luxembourg	1 vote

The Council represents national interests. If federation is unity in diversity, the Commission represents the unity and the Council the diversity. The balancing of individual interests and Community interests is accomplished by discussions between these institutions, culminating in the meetings of the Council of Ministers (the words of Walter Hallstein, former President of the European Community).

The Commission—Whereas the Council consists of politicians, the Commission consists of permanent officials. It has 14 members—3 each from France, the German Federal Republic and Italy, 2 each from Belgium and the Netherlands, and 1 from Luxembourg. They are the custodians of the supranational idea and are pledged to complete independence from national control. The business of the Commission is to further the general purposes of the treaties of the Communities and decisions are by majority vote. From the Commission flow two streams—

- (a) Proposals which it sends to the Council
- (b) Under powers of its own—
 - 1 Decisions to named countries and binding on them
 - 2 Directives to named countries to achieve certain results without specifying the means
 - 3 Recommendations and Opinions which are not binding
 - 4 Authorisations without which many things are forbidden

The Court whose procedure is wholly Continental consists of seven Judges appointed by Governments for a maximum of six years. Its word is final on the interpretation of the Treaty on the rules made under the Treaty and on the legality of all the actions of the organs of the Community.

Expansion of the EEC

Britain opened negotiations in June 1970 on its third attempt to join the Common Market. The application had been made by the previous Labour government but it fell to the new Conservative

government to actually begin the talks. The hope was at that time that the talks on British entry and on the entry of her fellow candidates Denmark, Norway and Ireland could be completed by mid 1971. At the time of going to press Britain had secured useful but marginal agreements on the marketing of some agricultural products and agreement in principle on associate status for African Commonwealth countries and Gibraltar. It had also secured agreement to have a single five year period for adaptation in both the industrial and agricultural fields. But discussion on the vital details of the timetable for raising food prices and adapting the industrial customs union had not been settled. The British budget proposals had made it clear to the Six that Britain was unlikely to agree to make contributions to the Community exchequer in the early years that would endanger her own balance of payments.

Doubts in Britain

Opposition to British entry grew in this country as the prospects for entry became more favourable. It is considered possible that faced with a final decision a majority of the Labour Party might be against entry.

The Future of the EEC

Complicating the negotiations for an expansion of the EEC are various unresolved issues about the future development of the organisation. In late 1970 the Council of Ministers for the third consecutive year deferred reform of common agricultural policy. The Council also failed to agree on the Werner Plan for monetary and economic union. This report outlined three stages for achieving monetary and economic union by 1980. If the recommendations were carried out more power would be vested in the Commission and in the European Parliament so that decisions would create a common currency, common tax policies and common economic guidelines could be effectively taken. See also Section 6 Part IV.

Beyond these immediate and pressing problems lie other questions such as the harmonisation of European foreign policies and defence policies. Nuclear weapons pooling by Britain and France would in itself raise serious issues since Germany is unable to participate in any nuclear force and an agreement between France and Britain might well alienate Germany at a time when its own Ostpolitik is modifying its commitment to Western Europe.

5 Scientific and Technological Organisations

Euratom is the short title of the European Atomic Energy Community (EAEC) formed in 1957 to further the use of nuclear energy in Europe for peaceful purposes and to ensure that Europe does not lag behind in the atomic revolution. The negotiation for this Community opened at the same time in 1956 as that for the Common Market and the Treaty for it was signed at Rome on 25 March 1957 when the Treaty for the Common Market was signed. Prior to the merger in July 1967 of the three executive bodies of the Common Market, Euratom and the Coal and Steel Community into a single Commission and of the three Councils into a single Council, Euratom was supervised by its own Commission. Euratom's role is to ensure that the Community undertakes the research necessary for the development of nuclear energy not only for power but also through the use of radioisotopes and radioactive sources for agricultural, industrial and medical purposes. It has joined international projects such as the European Nuclear Energy Agency (ENEA), *Dragon* project at Winfrith, Dorset which is sponsored by OECD.

The Six Co-ordinate on Scientific and Technological Policies—The Council of Ministers in 1967 reached agreement on a procedure for such co-ordination. Existing co-operation in international organisations included ELDO (European Rocket Launcher Development Organisation).

ESRO (European Space Research Organisation) and CERN (European Nuclear Research Centre) in all of which the Six are associated with Britain (But in 1968 Britain announced its withdrawal from ELDO when the present development programme ends in 1972). The urgency of the general problem of co-operation has been sharpened by growing anxiety in Europe generally about the consequences of a technological gap: the difficulties actually encountered in *ad hoc* co-operation—in the aero space sector for example—and the extensive overlapping of effort and expenditure.

OTHER GROUPINGS OF STATES

1 Military Alliances

NATO—The principal Western defence organisation with prime responsibility for opposing Communist forces in Europe. See C38.

The Warsaw Pact formed in 1955 groups the Soviet Union, Bulgaria, Czechoslovakia, East Germany, Hungary, Poland and Rumania. Its full title is the Eastern European Mutual Assistance Treaty.

ANZUS Council, a loose military alliance grouping Australia, New Zealand and the United States.

Central Treaty Organisation (CENTO) The successor to the Baghdad Pact alliance of 1955. CENTO groups Great Britain, Iran, Pakistan and Turkey with the US as an associate member. It is regarded as of limited effectiveness.

South East Asia Treaty Organisation was formed in 1955 and groups Australia, France, Great Britain, New Zealand, Pakistan, the Philippines, Siam and the United States. France, Pakistan and Britain have virtually withdrawn.

2 Organisations of the Third World

The Third World is the name given to those countries representing the less privileged part of the world, most of them forming part of neither the Western (Capitalist) bloc nor the Eastern (Communist) bloc. They are sometimes called non-aligned or uncommitted nations. They have three permanent organisations:

(a) The Afro-Asian People's Solidarity Council (1957)

(b) The Afro-Asian Organisation for Economic Co-operation (1958) and

(c) The Three Continents Solidarity Organisation (1966)

The Bandung Conference of 1955 in Indonesia was the first inter-continental conference of the so-called coloured peoples in the history of the world. It adopted a Declaration on Problems of Dependent Peoples that colonialism was an evil and should be brought to an end. It also adopted a Declaration on World Peace and Co-operation involving five principles of peaceful co-existence. Other conferences of the Third World have been:

The Belgrade Conference of 1961 was attended by 25 countries and adopted a 27-point declaration containing their common views on international problems and an Appeal for Peace addressed particularly to the USA and the USSR.

The Cairo Conference of 1964 at which 47 countries attended. Neo-colonialism and imperialism in all forms were condemned particularly in South Africa.

3 Regional Political and Economic Groupings

EEC—the principal European political and economic grouping. See C38(2), C39(2).

Comecon The Council for Mutual Economic Assistance groups the Soviet Union, the East European Warsaw Pact members and Outer Mongolia. Its aim is to co-ordinate and integrate members' economies, but the organisation has been under considerable strain in recent years.

Organisation of American States groups 23 American countries of which one, Cuba, has been suspended. Its central organ is the Pan American Union.

The Organisation of Central American States (OCAS) was set up in 1961.

Members: Costa Rica, El Salvador, Guatemala, Honduras, Nicaragua.

Latin American Free Trade Association (LAFTA) was formed in 1960 and now comprises 11 nations—Argentina, Bolivia, Brazil, Chile, Colombia, Ecuador, Mexico, Paraguay, Peru, Uruguay, Venezuela.

The Arab League with its seat at Cairo comprises Algeria, Iraq, Jordan, Kuwait, Lebanon, Libya, Morocco, Saudi Arabia, Sudan, Syrian Arab Republic, Tunisia, United Arab Republic and Yemen. A Pact of the Union of Arab States was signed in 1945 by representatives of Egypt, Iraq, Lebanon, Saudi Arabia, Syria, Transjordan and Yemen. Later adherents were Libya, Sudan, Tunisia, Morocco, Kuwait and Algeria.

The Organisation of African Unity (OAU) was constituted at Addis Ababa in 1963. All independent countries in Africa except South Africa are members of the OAU.

There are a number of regional organisations in Africa such as (1) the East African Common Services Organisation (1962) for Kenya, Tanzania and Uganda, and (2) the West African Common Market (1967) comprising twelve countries—Dahomey, Ghana, Ivory Coast, Liberia, Mali, Mauritania, Niger, Nigeria, Senegal, Sierra Leone, Togo and Upper Volta.

The Colombo Plan, owing its inception in 1951 to the Commonwealth Consultative Committee, is a plan for the economic development of South and South East Asia. It was originally adopted for development programmes in India, Pakistan, Ceylon, Malaya, Singapore, North Borneo and Sarawak, but the scheme has been widened to include non-Commonwealth countries and the USA has agreed to join Australia, Britain, Canada and New Zealand in making available aid within the framework of the Colombo Plan.

Organisation Commune Africaine et Malgache (OCAM) groups 13 French-speaking African countries and Malagasy. A regional organisation within OAU.

HEATH'S CONSERVATIVE GOVERNMENT

(as re-formed October 1970)

Prime Minister and First Lord of the Treasury—Edward Heath
Secretary of State for the Home Department—Reginald Maudling
Secretary of State for Foreign and Commonwealth Affairs—Sir Alec Douglas
 Home
Chancellor of the Exchequer—Anthony Barber
Lord Chancellor—Lord Hailsham
Lord President of the Council—William Whitelaw
Secretary of State for Defence—Lord Carington
Secretary of State for Social Services—Sir Keith Joseph
Chancellor of the Duchy of Lancaster—Geoffrey Rippon
 (Minister in charge of European negotiations)
Secretary of State for Trade and Industry and President of the Board of Trade—
 John Davies
Secretary of State for Employment—Robert Carr
Secretary of State for Education and Science—Margaret Thatcher
Secretary of State for Scotland—Gordon Campbell
Lord Privy Seal—Earl Jellicoe
Secretary of State for the Environment—Peter Walker
Secretary of State for Wales—Peter Thomas
Minister of Agriculture, Fisheries, and Food—James Prior

Speaker of the House of Commons—J. Selwyn Lloyd
Leader of the Opposition—Harold Wilson

MINISTERS NOT IN THE CABINET

Minister for Trade—Michael Noble
Minister for Industry—Sir John Eden
Minister of Aviation Supply—Frederick Corfield
 (this Ministry is being transferred to the Ministry of Defence)
Minister for Housing and Reconstruction—Julian Amery
Minister for Transport Industries—John Peyton
Minister for Local Government and Development—Graham Page
Parliamentary Secretary, Treasury (Chief Whip)—Francis Pym
Minister of Overseas Development—Richard Wood
Paymaster General—Viscount Eccles
 (Minister with special responsibility for the arts)
Ministers of State, Home Office—Richard Sharples, Lord Windlesham
Minister of State, Foreign and Commonwealth Office—Joseph Godber
Chief Secretary to the Treasury—Patrick Jenkin
Minister of State, Treasury—Terence Higgins
Minister of State, Ministry of Defence—Lord Balmal
Minister of State, Department of Health and Social Security—Lord Aberdare
Minister of State, Department of Employment—Paul Bryan
Minister of State, Scottish Office—Lady Tweedsmuir
Minister of Posts and Telecommunications—Christopher Chataway
Minister of State, Welsh Office—James Gibson Watt
*Lord Commissioner of H. M. Treasury and Parliamentary Secretary, Civil Service
 Department*—David Howell
Minister without Portfolio—Lord Drumalbyn

Law Officers

Attorney General—Sir Peter Rawlinson
Solicitor General—Sir Geoffrey Howe
Lord Advocate—Norman Wylie
Solicitor General for Scotland—David Brand

ENGLISH LAW

A concise survey of the English legal system, its history and development from early times, with further detail of some particular branches of the law which are of practical interest to the ordinary citizen

THE SYSTEM OF ENGLISH COURTS

I CIVIL COURTS

PERNY SESSIONAL COURTS

- 1 In Boroughs
1 Stipendiary Magistrate (Lawyer)
- 2 Elsewhere
2 or more Justices of the Peace (Laymen and Legal Clerks)

Trying Domestic Proceedings (disputes between husband and wife) custody and maintenance of children adoption and bastardy

Appeals to

Divisional Court of Divorce Division
(2 or more High Court Judges)

4 Queen's Bench Division
(1 High Court Judge)
Hears appeals from
Common Law and Admiralty cases (collisions of ships at sea etc.)

5 Family Division
(1 High Court Judge)
Hears divorce and other matrimonial causes including claims to family homes and property maintenance for wives and (sometimes) husbands and children custody adoption legitimacy wardship of property guardianship and family provision

6 Chancery Division
(1 High Court Judge)
Hears A Equitable cases (D7)
B Disputes over wills

7 Restrictive Practices Court
(Laymen and High Court Judges as Chairman)
Hears applications by Traders to allow Restrictive Practices

- 3 COUNTY COURTS
(1 legally qualified Judge)
Hears—
A Civil cases involving Contract and Tort not exceeding £750
L Disputes between Landlord and Tenant
C Disputes between husband and wife on Property
D Adoption
F Undeclared Divorce Cases

SUPREME COURT OF JUDICATURE
HIGH COURT OF JUSTICE

Appeals to

8 COURT OF APPEAL (CIVIL DIVISION)

(2 or more High Court Judges—usually including Master of the Rolls)

Appeal (with leave) to

9 HOUSE OF LORDS

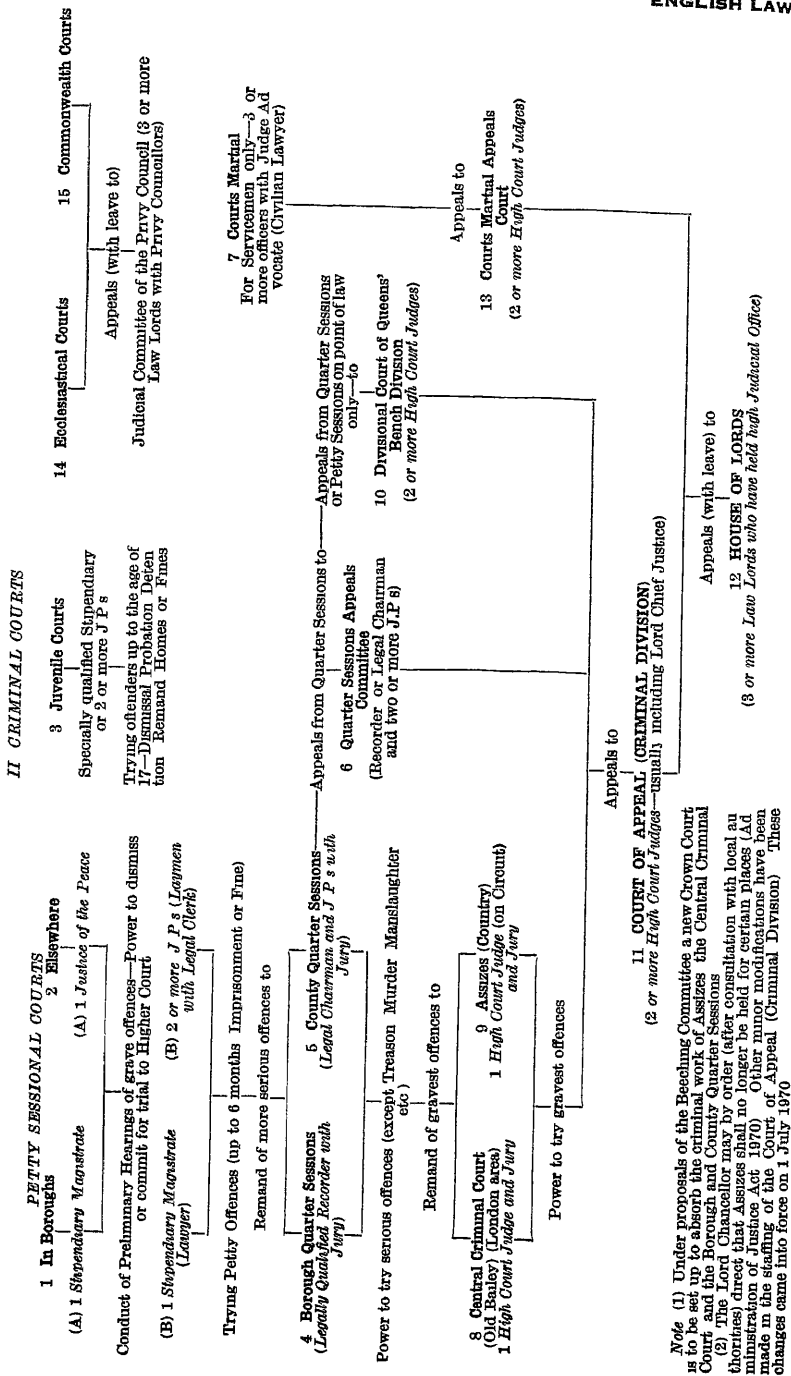

(3 or more Law Lords who have held High Judicial Office)

APPEALS ON CIVIL MATTERS FROM
10 Ecclesiastical Courts 11 Commonwealth Courts

12 JUDICIAL COMMITTEE OF THE PRIVY COUNCIL
(3 or more Law Lords with Privy Counsellors)

Note

- (1) The Administration of Justice Act, 1969 permits appeals in certain cases direct from the High Court to the House of Lords to save expense.
(2) The institution of the Family Division and consequential changes in the other Divisions were at the time of writing expected in the spring of 1971

ENGLISH LAW

The Table set out on D4 shows in concise form

- I. The Sources
- II. The Subdivisions

of the Law of England. The intention is to give a general picture of the whole system in tabular form to explain briefly what the Table represents and finally to deal in slightly more detail with a few selected subjects which may be of particular interest to the ordinary reader.

A word of warning is necessary. Learned text books have been written on every one of the many subjects referred to in the Table and the application of the law in any particular case is a matter for the professional expert. The following pages do not claim to do more than to make a brief survey of the whole field of English Law for the general guidance and interest of the ordinary citizen.

The system of English Courts as restructured under the Administration of Justice Act 1970 is set out in tabular form on D5 and D6.

I THE SOURCES OF ENGLISH LAW

The citizen who desires to make some acquaintance with the English Legal System must begin by disabusing himself of several popular fallacies for example that it is a fixed and unalterable code that it is strictly logical that it is coldly impersonal and uninfluenced by human factors. The history and practice of the law display precisely the opposite characteristics.

1 COMMON LAW AND CASE LAW

The English Legal System is a living organism not a dead static code. The system as we know it began to develop in the 12th century when Henry II extended the practice of sending the royal judges about the country on circuit to deal with crimes and disputes and to adapt and give official authority to the best of the local customs some of which had been in force since Anglo-Saxon days. The judges did this by empirical methods—that is by practical common sense decisions on the actual cases brought before them and by setting out their reasoning in detail. Simple records of the most important decisions were kept from the earliest times as the centuries passed the gradual elaboration of a system of law reporting ensured that the facts of significant cases the reasoned judgments delivered on those facts and the principles those judgments enshrined should be recorded and preserved at the same time the doctrine of precedent—the rule that those principles enunciated by a superior court should be followed by all courts inferior to it—ensured consistency throughout the country. Thus there was gradually developed a body of principles—living growing and adaptable to new sets of facts as they arose principles moreover which rose above local differences of custom and became common to the whole Realm. Hence the expression *common law*.

Case Law. The system we have described is by no means a thing of the past. It is still in force today. New circumstances are continually arising cases come before the judges for decision and it frequently happens that the principles laid down in the past do not apply precisely in all respects to the particular facts in point. When this occurs it is the judge's right and duty to interpret and adapt the principle to the new facts before him his judgment is reported and his reasoning made clear. The adapted principle of that judgment becomes part of the law of England it must be followed by all inferior courts and it will not be ignored or abandoned by courts of the same rank or any superior court without reasoned argument and careful consideration. Thus the practising lawyer can never sit back with the comfortable assurance that he has completed his studies he must continually keep his knowledge up to date. The practice of law is not based on rigid rules but is the art of applying the known principles to the facts of new cases as they arise.

In July 1966 the House of Lords (the Supreme

Court of Appeal) announced that it would henceforth regard itself as free to depart from its own previous decisions when it appeared right to do so though this power would be sparingly used.

2 EQUITY

But the English genius for practical improvisation has never excluded spiritual and ethical motives of conduct. For hundreds of years the Church was a great power in the land extending its influence far beyond the strictly ecclesiastical sphere. The great church leaders of the past took an important part in the secular activities of government and administration from an early date the King's Chancellor was an ecclesiastic. The Chancellor was not only the King's Secretary of State and Keeper of the royal seal as royal chaplain he was Keeper of the King's conscience. It was to him therefore that the King turned for advice on matters of state where ethical and moral considerations were involved.

All human institutions are fallible and the rough and ready methods of the early common law sometimes fell short of those ideals of abstract justice that inspire men's minds. Despite or perhaps because of its practical outlook the common law tended to become circumscribed by its own precedents. As the machinery of justice became more elaborately organised the idealistic doctrine—Where there is a right there is a remedy—was apt to degenerate in practice into the realistic but soulless form—Where there is a legal remedy there is a legal right. Too close an adherence to legal formalities led sometimes to a denial of justice. This was particularly so for the weak who could not help themselves—feeble minded persons tricked or cajoled into legally signing away their property minors unconsciously treated by guardians who having got legal custody (under a will or otherwise) of a minor's inheritance refused to honour their solemn trusts borrowers who having delayed beyond the date fixed for the repayment of a loan found themselves deprived under the strict terms of the mortgage deed of property many times more valuable which they had pledged only as security. For such cases as these the common law courts provided no remedy since the victims had suffered no actual illegality. Petitions were therefore sent to the King—the father of his people—begging him to right such wrongs and the question of redress was delegated by the King to his Chancellor. The Chancellor had no power directly to revoke or interfere with the decisions of the royal judges by depriving the oppressive party of the property he had legally acquired, but he could and did insist that that party should not enjoy such acquisition unconscionably for his own sole advantage. The defaulting guardian though he continued legally to hold the minor's property was compelled to use it for the minor's benefit the oppressive creditor who had legally got

possession of or sold the debtor's estate was permitted to take out of the proceeds the amount of his loan with reasonable interest and expenses but must hand back the balance to the debtor. Thus the Chancellor administered a kind of *abstract justice* based upon the promptings of conscience and not on legalistic rules. He dealt with these cases in his own court—the Chancery or Chancery—where the yardstick was *equity*—that which was right or fair. And over the centuries the principles on which the Court of Chancery acted became crystallised into a set of rules which followed their own precedents and made conscientious conduct their guiding star.

Naturally enough the activities of the Court of Chancery were viewed with jealousy and misgiving by the royal judges of the Common Law Courts and many were the clashes between the two. Equity however had come to stay and the two systems were administered independently until as late as 1873. In that year Parliament passed the Supreme Court of Judicature Act which (in effect) fused the two systems into one. By means of that and subsequent legislation there was constituted one *High Court of Justice* of which the *Queen's Bench Division*, the *Chancery Division* and the *Probate, Divorce and Admiralty Division* were component parts. The first named was concerned primarily with common law suits; the second with equitable matters but both these Divisions must have regard to both common law and equitable principles. In case of a conflict of principles those of equity are to prevail. The last named Division (for historical reasons) dealt with the diverse subjects of wills and intestacies, matrimonial suits and disputes relating to ships at sea. Criminal cases fall within the jurisdiction of the Queen's Bench Division but are dealt with in special courts (see D6). The criminal law (in strict fairness to accused persons) must be also lately certain and clearly defined; it is administered on strict legalistic principles from which the doctrines of equity are excluded.

By the Administration of Justice Act 1970 the system of courts was revised. A new *Family Division* deals with all matrimonial and family matters (see D5); probate work is taken over by the Chancery Division while Admiralty work is dealt with by a special section of the Queen's Bench Division.

3 STATUTE LAW

While as we have shown the Courts have the function of interpreting and adapting the prin-

ciples of law laid down in earlier times they can not legislate—i.e. the Judge cannot make new laws or repeal or amend old laws even when changes are rendered desirable by developing social conditions. The law-making body or *Legislature* is *Parliament*. A *Statute* or *Act of Parliament* is the joint act of the Queen, the House of Lords and the House of Commons while each of these three Estates of the Realm has its own functions. New law can be made and old law repealed only by these three Estates acting together i.e. by Parliament or by some person or body of persons to whom Parliament has delegated authority to make rules having the force of law. Parliament is free of control by any written constitution or any person or body of persons whatsoever. An Act of Parliament must be enforced by all courts as the law of the land unless and until it is repealed or amended by Parliament itself. Parliament is not bound by the Acts of a previous parliament which it is free to repeal or amend as occasion may require. It is equally free to modify the rules of the common law and the rules of equity however firmly entrenched but those rules unless and until modified by parliamentary legislation continue to guide the Judges both in their interpretation and enforcement of *Statute Law*—i.e. the body of Acts of Parliament still in force for the time being—and in their decisions on those common law and equitable rules which the Statute Law has left untouched. For example the Peerage Act 1963 enables a peer to renounce his title and to become a commoner for all purposes including voting for and standing as a candidate for the House of Commons. By the Law Commission Act 1965 a body of Commissioners was appointed (1) to consider various branches of the law (2) to consolidate and codify the law wherever possible (3) to draft reforms on certain subjects. The Commission's Fifth Report issued late in 1970 reviews recommendations for the first five years of its activities and is referred to under various headings in the text that follows.

THE ENGLISH LEGAL SYSTEM

These three main streams—*common law* (and *case law*), *equity* and *statute law*—have flowed throughout the centuries sometimes independently and sometimes in conjunction to feed the waters of that great river which is the English Legal System.

II THE SUBDIVISIONS OF ENGLISH LAW

I CONSTITUTIONAL LAW

This is that part of the English Legal System which relates to four main branches of national administration—

- (a) *The Legislature*—i.e. the law-making body known as Parliament
- (b) *The Executive*—i.e. the Government and the functions of its various components
- (c) *The Judiciary*—i.e. the Judges, their Courts and powers
- (d) *Local Government*—i.e. the Local Authorities and their powers

The two main principles of the Constitution are—

1 The Supremacy of Parliament—i.e. there is nothing that Parliament cannot lawfully do and there is no person or body of persons above Parliament. Its Acts cannot be unconstitutional since it can itself modify the Constitution at will. Its Acts for the time being in force are the law of the land and nobody can question their validity.

2 The Rule of Law—This means that no person or body of persons is above the law of the land and

that there is one system of law and one system alone for everybody. This principle was reaffirmed by the Court of Appeal in the *Enfield schools cases* in August 1967—ministries and local councils must obey the law like everybody else. There is not in England as there is in some other states a special system of law and special courts for scrutinising the acts of ministers, civil servants or other functionaries; such persons are bound by the same rules of conduct as other citizens. A complaint by a private citizen against a Secretary of State or a Commissioner of Police is investigated by the same courts and under the same legal rules as a complaint against another private citizen. Any apparent exception will be found to result from some special provision in an Act of Parliament itself. For example the Army Act sets up a code of conduct for officers and soldiers and does not apply to civilians but that code is part of the Law of England because it is contained in an Act of Parliament—a code which (incidentally) remains valid only if it is confirmed by Parliament in every successive year. Again, the Emergency Powers (Defence) Act 1939 conferred upon the Crown and its Ministers extensive powers during the last war to make Defence Regulations which should have the force of law but the Act itself had to be passed by Parliament with the proper formalities. Such Regulations derive their legal and binding effect solely from the powers delegated by Parliament and the High

Court of Justice is competent to scrutinise and frequently does scrutinise the wording of the Regulations and the manner in which those powers are exercised, and so satisfy itself that the Minister concerned is not attempting to exceed the authority which Parliament has vested in him—in other words to protect the citizen against the arbitrary abuse of lawful powers and against their unlawful enlargement. Delegated legislation is always subject to such control: parliamentary legislation is not, since nobody can question the validity of an Act of Parliament. But the interpretation of any Act of Parliament—the ascertainment of its legal meaning and effect—is one of the proper functions of the Courts. By an Act of Parliament in 1966 an office new to the British Constitution was set up—that of Parliamentary Commissioner or Ombudsman (a name borrowed from a Scandinavian institution) to whom complaints of injustice by Government departments may be made.

II CRIMINAL LAW

This is that part of the English Legal System which deals with the relations between the individual citizen and society as a whole. Thus if A murders or robs B the question of redress is not one merely for B or his family: the victim cannot in a civilised community be permitted to take the law into his own hands, nor can it be left to him to decide what action should be taken against the offender—otherwise blood feuds and public disorder would result. But that reason it has been the law for centuries past that in the case of offences (1) against public order, (2) against the person and (3) against property the State (representing society as a whole) itself intervenes and prosecutes the offender for the purpose of upholding public order and vindicating the rule of law by inflicting punishment upon him—not for the purpose of compensating the injured party (which as will be seen below is the contrasting function of Civil Law). But recent legislation includes power to make payment of compensation for personal injuries to victims of violent crime. For offences against public order *see* D44-6.

The two main categories of Crime (as the Tables (D4-6) show) are—

(a) **Grave Indictable or Arrestable Offences** which are dealt with at Assizes the Central Criminal Court and Quarter Sessions, and which carry severe penalties—death or lengthy sentences of imprisonment (death only for treason in time of war). (*See also* D10-11.) Proposals have been made to re-arrange the Criminal Courts (*See* D6).

(b) **Petty or (now) Non-arrestable Offences** which are dealt with in Magistrates' Courts and are punishable by light sentences of imprisonment or by fines (with short sentences in the alternative). Examples of this latter class are (*e.g.* under the Road Traffic Acts) driving without due care and attention exceeding the speed limit causing an obstruction etc. (*See also* Justices of the Peace D43-4.)

Examples of (a) Grave Indictable or Arrestable Offences are set out in the Table (D4) under the three main headings of

- (1) Offences against Public Order
- (2) Offences against the Person and
- (3) Offences against Property

In connection with all these categories of offences the Criminal Law is concerned with the following general considerations—

(a) **Criminal Responsibility**—*I.e.* the primary principle that every person is presumed (until the contrary is proved) to be sane provided that his acts are voluntary (*i.e.* intentional). It would for example be absurd for a man accused of wounding another person by shooting to plead that he did not intend, when he discharged the firearm at the other person, to do him any bodily

harm. On the other hand it would be outrageous to convict and punish a child of four who without understanding the wrongfulness of his behaviour picked up and took away some attractive and valuable object from a shop counter, a lunatic who killed somebody under an insane delusion that the victim was a wild beast, a boy (like Oliver Twist) who was compelled by force or violent threats to break into a house or a man who took an overcoat from a public cloak room honestly but mistakenly believing it to be his own. In none of these last illustrations is the act a voluntary one in the sense that there was the intention to do something wrong. To the rule that an act is not a crime unless it is intentional in this sense there are a few rare exceptions—cases where an Act of Parliament has expressly and clearly made some form of conduct punishable in itself whether it was intentional or not for example during the War permitting a light to be visible in black out hours was punishable even if it was unintentional and involuntary on the part of the accused. And *see* Criminal Justice Act 1967 D10.

Intention must not be confused with **motive**. For example in what has become known as **mercy killing**—*i.e.* taking the life of a person suffering from a painful and incurable disease—the killer is often actuated by a good motive—the desire to relieve hopeless suffering—but the intention is to kill and the act is therefore a crime (it is not necessary for the prosecution to prove any motive).

The **burden of proof** in criminal cases is on the prosecution *i.e.* it is the duty of the prosecution to prove the accused guilty, not the duty of the accused to prove his innocence. The accused is presumed to be innocent unless and until his guilt is proved to the reasonable satisfaction of a jury. The jury are the sole judges of the true facts of the case and their verdict had to be unanimous until recently but by the Criminal Justice Act 1967 it may now be by a majority of 1 to 2. The Act also contains a clause for major changes in committal proceedings by magistrates. *See below* D10.

(b) **Unconsummated Crimes**—*I.e.* attempts to commit crimes which are frustrated by some out side event or by some person's intervention. For obvious reasons the attempt to commit a grave crime is itself an offence for which the offender can be prosecuted and, if convicted, of the attempt punished by fine or imprisonment. **Inchoate** by one person or another to commit a crime and **conspiracy** between two or more persons to commit a crime are usually offences in themselves whether the attempt or the conspiracy proves successful or not.

(c) **Joint Crimes** are those in which two or more persons take part. Such participation may arise in different ways. **A principal in the first degree** is the man who commits the actual offence with **guilty intention** (*see* (a) above) or who induces its commission by some other person who himself does not understand what he is doing. **A principal in the second degree** is one who aids and abets the guilty perpetrator at the time when the crime is committed. **An accessory before the fact** is one who instigates or helps to prepare the commission of the crime by another person though not himself present when that other person commits it. In most cases all these three classes of participants in a crime are equally guilty and liable to the same punishment provided that all of them shared the same common criminal purpose. (Thus if two armed burglars break into a house with their weapons drawn and one of them shoots and kills the householder both will be guilty of murder while the accomplice who helped to plan the burglary will be equally guilty if the plan included the carrying of loaded weapons.)

(d) **Punishment and its Purpose**—The purpose of punishment is fourfold—

(1) **Retribution**—to demonstrate to the community in general that crime does not pay and thus to uphold the rule of law.

and to prevent the deterioration of public morals

(ii) *Prevention*—to restrain offenders so far as possible from repeating their crimes by keeping them in custody

(iii) *Reformation*—to make them so far as possible better citizens by means of moral and ethical training—teaching them to go straight and

(iv) *Deterrence*—to inspire among offenders and would be offenders a fear of and a healthy respect for the law and the strength of society as a whole which it protects

There has been much controversy on the relative importance of these four functions of punishment. Until comparatively recent times *deterrence* was considered the primary function and punishments were correspondingly severe and by modern standards savage. Experience has shown how over that crime is not effectively reduced merely by severity of punishment but rather by the certainty or probability of detection and conviction. And particularly during the past half-century *reformation* of the offender whenever possible has become a paramount aim not only on grounds of humanity but also for the purpose of reducing the wastage of human material which can frequently be saved from a life of crime if it is taken in hand firmly but kindly at an early stage (see D47). The Children and Young Persons Act 1969 makes radical reforms in the law and practice relating to children hitherto brought before Juvenile Courts. A summary of the Act appears on D41-3.

(e) *Insanity*—If a person does an act which if *voluntary or intentional* would constitute a *crime* (see Criminal Responsibility D9) and his legal advisers put forward a defence of insanity he can still be convicted unless he can prove to the satisfaction of a jury that he was suffering from such a defect of reason due to disease of the mind as not to know the nature and quality of the act he was doing or (if he did not know this) not to know that what he was doing was wrong. Medical men, psychologists and social reformers have long regarded this rule (which has been in force since 1843) as too severe. It was a rule applicable to all crimes but the controversy became associated in the public mind chiefly with *murder*. The rule was amended by section 2 of the Homicide Act 1957 but only in its application to murder cases. It is now provided that a person who kills (or is a party to the killing of) another shall not be convicted of murder if he was suffering from such abnormality of mind as substantially impaired his mental responsibility for his acts and omissions in doing or being a party to the killing. (It does not matter whether the abnormality of mind arises from a condition of arrested or retarded development of mind or from any inherent causes or is induced by disease or injury.) The Act goes on to provide that a person who under the old law would have been convicted of murder shall instead be liable to be convicted of *manslaughter*.

In other crimes where the accused person is clearly proved to have been insane at the time the crime was committed the verdict is now 'Not guilty by reason of insanity'.

The Murder (Abolition of Death Penalty) Act, 1965 provides that no person shall suffer death for murder: a person convicted of murder shall be sentenced to imprisonment for life. In passing sentence the Court may declare the minimum period which it recommends the Home Secretary to allow to elapse before he orders the murderer's release on licence. The Act was to continue in force until 31 July 1970 and then expire unless both Houses of Parliament passed contrary resolutions. On a free vote in December 1969 both Houses reaffirmed that capital punishment for murder should be abolished.

The Criminal Justice Act 1967 revolutionises many provisions of criminal law and procedure—Magistrates or J.P.s conducting a preliminary

inquiry to determine whether there is a *prima facie* case for Quarter Sessions Assizes or the Central Criminal Court (D8) may commit an accused for trial on written evidence signed by the witness(es) who made the statement and declared by them to be true provided that a copy is handed to the defendant(s) solicitor or counsel none of whom objects but only if the accused is represented by counsel or solicitor. (The statement must be read over to any person who cannot read it.) If the witness is under the age of majority it must state his age. (The purpose is to save time.) In any case the Court may require such witness to give evidence by word of mouth either on its own initiative or on the request of any party. The same applies to the trial itself and admissions are to be good evidence.

Although the examining justices must sit in open Court no report of the proceedings may be published unless (a) one of the accused so requests or (b) the magistrates discharge the accused or (c) a brief summary of matters excluding evidence is printed. Penalty for unauthorised publication is £500. (Note: The purpose of these provisions is to avoid prejudice to the accused at the main trial.) Notice of discharge or committal must be displayed after the preliminary hearing. Any permitted publication is privileged.

A Court shall not be bound to infer intention or foresight of the results of the accused's actions but in every case shall decide whether that particular accused did intend or foresee them on the whole of the evidence. (This reverses a decision in 1962 *Director of Public Prosecutions v Smith* where the House of Lords inferred an intent to kill from the mere fact that the accused accelerated a car and drove with a policeman clinging to the bonnet.)

Notice of the defence of alibi must be given to the prosecutor at least 7 days before the end of the committal proceedings except with leave of the Court. (This is intended to avoid an alibi being sprung on the prosecutor at the last moment when he cannot disprove it.)

Verdicts of juries need no longer be unanimous. If there are not less than 11 jurors 10 may return a verdict if there are 10 jury may do so. But the jury must be allowed at least 2 hours for deliberation. Persons who have served a term of at least 3 months imprisonment (or in a borstal) sum marily or who have been sentenced to at least 5 years or for life (which usually means about 12 years) are disqualified from serving on a jury—penalty £25 but a verdict is not to be held void because of such disqualification.

Magistrates hearing an offence carrying not more than six months imprisonment may no longer refuse bail to an accused over seventeen on remand or committal or in certain other cases. No J.P. may take part in the trial if he knows of previous convictions (to avoid prejudice). A constable may arrest without warrant any person who he believes is likely to break his bail. If the J.P.s refuse bail the accused may apply for bail to the High Court. A Magistrates' Court shall not sentence an accused to imprisonment in his absence. Magistrates may now impose fines up to £400 (instead of £100). Imprisonment in default of payment is abolished except when the accused has means to pay but will not. Instead enforcement shall be by seizing his goods or by deduction from his earnings.

Preventive detention and corrective training are abolished as is also corporal punishment in prisons. Suspended sentences may be passed and *must* be if the term is for not over 6 months (except in special cases). If the accused commits a further offence he may have to serve the suspended sentence. The Home Secretary may make rules requiring a 'Social inquiry report' before sentence. Deportation of a Commonwealth immigrant may be substituted for imprisonment for life.

There is now power to release prisoners on licence to revoke such licence to remand or release young offenders to or from detention or approved schools.

The Criminal Law Act 1967 The old distinction into felonies and misdemeanours is abolished the expressions 'indictable and summary

The Criminal Law Act 1967 The old distinction into felonies and misdemeanours is abolished the expressions 'indictable and summary

offences are retained but for some purposes offences are divided into arrestable and non-arrestable offences. Arrestable offences are those for which (i) the sentence is fixed by law, those for which (ii) the offender is liable to five years imprisonment, and those which (iii) there has been an attempt (D9(2)-(b)) to commit. Arrestable offences therefore now include practically every variety of grave crime. Others are known as non-arrestable offences.

The old offence of being an accessory after the fact (except in treason) is abolished, instead a new offence of assisting offenders is created by the Criminal Law Act providing that where a person has committed an arrestable offence any other person who knowing or believing him to be guilty does without lawful authority or reasonable excuse any act with intent to impede his apprehension or prosecution shall be liable to periods of imprisonment proportionate to the sentence for the main offence. Where the arrestable offence is itself triable summarily (i.e. by a Magistrates' Court) with the defendant's consent then the offence of assisting is also so triable. But the proceedings may be brought only by or with the consent of the Director of Public Prosecutions. A husband or wife has no special exemption.

A new crime of concealing arrestable offences is created. In effect the new offence amounts to the prohibition of accepting a bribe in consideration of such concealment and the consent of the Director of Public Prosecutions must be obtained beforehand if a prosecution is contemplated. The defendant must know or believe that his information might be of material assistance in securing the conviction of an offender. But the common law rule that you may show mercy but shall not sell mercy is modified so that it is not unlawful to agree not to prosecute or give information on condition that the offender makes good any loss or injury caused by his offence or makes reasonable compensation for it. It remains unlawful to help to conceal any act of treason.

A new summary offence is created under the Act—the making of false reports to cause wasteful employment of the time of the police in regard to any kind of alleged offence.

Power is given to award compensation to the injured party in case of any indictable offence up to the sum of £400 (but compensation for damage due to an accident arising out of the presence of a motor vehicle on a road is excluded; such claims are covered by compulsory insurance). Such compensation may be awarded by the Court trying the offence.

Powers of arrest. Any person may now arrest (i) anyone who is in the act or whom he suspects to be in the act of committing an arrestable offence and (ii) where an arrestable offence has been committed anyone who is guilty or whom he suspects to be guilty of the offence. A constable may without warrant arrest (i) where he suspects with reasonable cause that an arrestable offence has been committed anyone whom he with reasonable cause suspects to be guilty, and (ii) anyone who is about to commit or whom the constable with reasonable cause suspects to be about to commit an arrestable offence. Common law powers of arrest such as to prevent violence or breach of the peace (D38) are unaffected by the new Act. A constable may enter (if necessary by force) and search any place where anyone (whom he has the right to arrest) is or where with reasonable cause he suspects him to be. A person may use such force as is reasonable in the circumstances in the prevention of crime or in effecting or assisting in the lawful arrest of offenders or suspected offenders or of persons unlawfully at large. (This power is not restricted to constables nor in actual terms to indictable offences, but the words "such force as is reasonable in the circumstances" prevent or by implication forbid the use of force for arrest in the case of trivial offences.)

The common law offence of *receiving* is defined as follows: "A person shall be treated as receiving property if he dishonestly undertakes or assists in its detention, removal or realisation by or for the benefit of another or if he arranges so to do. The common law crimes of theft and similar offences codified in the Larceny Act 1916 have now been

recoified expanded and more clearly defined by the Theft Act 1968.

III STATUS

A person's *Status*—i.e. his legal position in society—affects his legal rights and duties in most civil matters and in some few cases in criminal matters too (see Criminal Responsibility D9(1)).

1 **Nationality** in this connection means British Nationality under the British Nationality Acts the latest of which was passed in 1965. By the 1948 Act the term Commonwealth Citizen was created which can be used as an alternative to British Subject. A person may be a British subject by birth by naturalisation by marriage or by registration though under the Act of 1948 a woman who was not a British subject before marriage does not automatically acquire British nationality merely by reason of her marriage to a British subject. The law and the courts of this country can determine whether a person is a *British subject* or an *alien*; they cannot determine whether or not he is a citizen of some particular foreign state since that is a matter for the law of the foreign state concerned. Generally speaking in times of peace an alien in this country has the same rights and duties as a British subject except that an alien has no right to vote in parliamentary or municipal elections and that some professions (e.g. that of a solicitor) are closed to him. By the Act of 1964 a person who is stateless may apply to be registered as a citizen of the U.K. and Colonies if either parent was such a citizen when he was born or if the place of his birth is within the U.K. and Colonies at the time of his application. By the Act of 1965 alien wives of those British subjects who are not citizens of any Commonwealth country may be registered as British subjects.

2 **Domicil** means the country where a person has his permanent home without any present intention of changing it. His *domicil of origin* is that of his parents while he is a minor, at the age of majority he is free to acquire a new *domicil* by making his permanent home elsewhere. *Domicil* is of particular importance in matters of—

3 **Marriage and Divorce**—English law generally regards as valid a marriage ceremony carried out in this country after the proper preliminaries and with the proper formalities whatever the nationality or *domicil* of the parties. English law also accepts the validity of a marriage ceremony which has been carried out abroad according to the law of the country where it took place. But if one party or the other has an English *domicil* the *status of the marriage as an institution* must depend on English law whether the ceremony was in proper form or not. For example a man who has his permanent home in England cannot evade the English rule against consanguinity by going through a ceremony of marriage in Ruritania with his mother's sister—even if such a marriage is lawful by Ruritanian law and even if the ceremony has been carried out with the usual Ruritanian formalities it is still null and void by the law of England. The English court will not generally speaking grant a divorce to a man who is domiciled abroad since the law of the country which is his permanent home may not recognise this divorce or perhaps any divorce as valid and it is improper that he should be regarded as a single man in England and a married man in his homeland. Similarly English law will generally recognise the validity of a divorce granted by the proper court of his *domicil* (i.e. of the state where he had his permanent home at the time) or of a divorce which the law of his *domicil* regards as valid even if it was granted by a court elsewhere—and that whether he is a British subject or not. Under recent court decisions English law may also recognise a divorce granted by the court of a country with which he has some *genuine connection*. But a person whatever his nationality whose per

manent home is in England will not be regarded here as validly divorced merely because he has spent a few weeks in America, where divorce procedure is simple and has been granted a decree there. His status—married or single—generally depends on the law of his domicile—*i.e.* the law of the country which is his permanent home (See also D34(1)).

4 Minority is the status of a person under the age of majority (now eighteen). A minor cannot vote at elections; he cannot hold freehold or leasehold property and he cannot be made bankrupt. (In exceptional cases where the debt is for necessities (D14(1)), a bankruptcy notice may be issued against a minor.) If he enters into certain kinds of contracts during his minority he can repudiate them if he so desires up to a reasonable time after his majority. He cannot make a valid will and his rights under another person's will or settlement cannot be compromised or altered without the leave of the High Court. A minor cannot make a valid marriage without the consent of his parent or guardian or of the appropriate court. His rights are now the special care of the Family Division of the High Court which will protect those rights according to the Rules of Equity (see D8(1)). The Family Law Reform Act 1969 has reduced the age of majority to eighteen for all purposes including the parliamentary vote and marriage without parental consent. Minor and minority may now be used in all cases instead of infant and infancy.

5 Lunacy in the broad legal sense is the status of a person who is incapable by reason of unsoundness of mind of managing his affairs.

Lunacy in this sense is not necessarily identical with any of the mental conditions to which such psychological terms as insanity, imbecility, idiocy and the like are applied; there need be no actual mental disease. When a person becomes incapable for this reason of managing his affairs the law in order to protect both him and society at large changes his status by putting the custody of his person or the control of his property or both into reliable hands. Such matters come under the supervision of the Chancery Division since one of the functions of Equity (see above) is to protect those who cannot help themselves. Certification of insanity (in the psychological sense) is not necessary, but with the proper medical certificate and legal safeguards the *patient* (as he must be called) may be removed to a mental hospital. Some reliable person (usually a near relative) may be appointed by an Order of the Court of Protection (a branch of the Chancery Division) as Receiver of his property. The Receiver's duties are to look after the property and income of the patient, pay his debts and defray the expenses of his maintenance and medical care and generally to deal with the patient's property on the patient's behalf. Periodical accounts must be submitted to the Court which will scrutinise them strictly and at once intervene if there appears to be any irregularity on the part of the Receiver. If there is no relative to take the responsibility the Official Solicitor at the Royal Courts of Justice will be appointed as Receiver with the same duties and liabilities.

Apart from these matters of administration a person of unsound mind is regarded as incapable of making a valid will of entering into a legal agreement or of dealing with his property. None of these transactions is valid unless the person concerned understood the nature and effect of what he was doing and whether he did understand or not is a question of evidence in every individual case. Medical and other witnesses must testify to his conduct and demeanour at the time when he entered into the transaction in question. If the Court comes to the conclusion that he was unable to understand the nature and effect of the transaction the Court will *rescind—i.e.* set aside or cancel—the transaction, even though it was in proper legal form. By the Administration of Justice Act, 1969 the Court of Protection may now authorise the execution of a will or codicil for the patient.

6 Bankruptcy is the creation of Statute Law—there was no common law of bankruptcy. It is the status of a person (the debtor) who is *insolvent—i.e.* who is unable to pay his debts (exceeding £50) as they fall due. By the appropriate procedure the State takes the management of the debtor's property out of his hands and places it in the hands of the Official Receiver whose duty it is to realise it and (subject to certain privileged claims) to distribute it proportionately among his creditors. The procedure is that one of the creditors files at the Bankruptcy Court a bankruptcy petition on which the Court may make a receiving order which has the effect of transferring the legal management of the debtor's property to the Official Receiver. That official investigates the debtor's finances and draws up an account called a *statement of affairs* showing the debtor's liabilities and assets. There is a meeting of creditors and a public examination of the debtor in Court as a result of which the Court may either discharge the receiving order (on the debtor's showing that he can pay his debts if he is given time or persuade the general body of creditors to accept his proposals for a composition of so much in the £) or the Court may adjudicate the debtor a bankrupt. In the latter case it is open to the creditors either to leave the management of the debtor's property in the Official Receiver's hands or themselves to appoint a trustee in bankruptcy (usually an accountant) nominated by some or all of them and that trustee takes over the management of the debtor's affairs. The debtor is bound under penalty to give full information about his affairs to the Official Receiver and the trustee in bankruptcy; he cannot while he is a bankrupt sit or vote in Parliament or act as a Justice of the Peace or in certain other offices. He will be committing an offence if he conceals any property or debt or falsifies his books of account if he obtains property on credit or secures credit of £10 or more without disclosing his status if he trades without such disclosure or fails to keep proper books of account or if he leaves or attempts to leave the country taking with him property worth £20 or more which ought to be divided among his creditors. It is also an offence for him to transfer property with intent to defraud any creditor and any such transaction may be set aside by the Court.

7 A Corporation or Incorporated Body is an association of persons recognised by Act of Parliament or by its Charter as one single legal entity. It may be a *chartered* or a *statutory corporation* (e.g. the British Broadcasting Corporation or the London Transport Board) or a *local authority* (e.g. the Greater London Council or the Westminster City Council) or a *company* incorporated under the Companies Act 1948 or one of the earlier Companies Acts. Generally speaking a corporation of any kind has power only to do such things as it is given power to do by its Charter or by the Act of Parliament under which it was constituted, if it goes beyond that power it is behaving *ultra vires—i.e.* beyond its powers—and such acts on its part will be regarded by the Courts as null and void. The Court may also restrain the corporation by *injunction*—an Order forbidding it to act in such a manner.

Every corporation being a single legal entity is a legal person distinct from the individuals who are its members. Thus the corporation itself can take proceedings or have proceedings brought against it in the Civil Courts and it may itself be prosecuted in the Criminal Courts if it commits an offence and is liable to a fine. No personal liability rests upon its individual members, directors or officers unless they have personally done something unlawful or aided and abetted the corporation in its wrongdoing. The corporation itself can enter into a legal agreement with one or more of its members or a member of the public and any person injured by its acts can enforce his legal rights against the property or assets of the corporation which are distinct from the property or assets of the individuals who compose it.

A *company* is usually a commercial concern and generally takes advantage of the principle of *limited liability* in which case the last word in

its name must be the word *Limited*. The principle is that in the event of the company's becoming insolvent, none of its members can be compelled to contribute to its funds a larger sum than the sum which he agreed to pay for his shares, however large the indebtedness of the company itself. Every company must file at the Companies Registry a *Memorandum of Association* setting out its name, the situation of its registered office, its objects (beyond which it has no power to act), its capital and whether or not it is *limited*. It should also file its *Articles of Association* setting out its rules of management, the method of issuing allotments and transferring its shares, the procedure for meetings, the powers and duties of its directors and other officers, and similar matters. If and when its objects have been fully achieved, or if it is desired to discontinue its activities or if it becomes insolvent, it will be wound up and dissolved. The winding up is undertaken by a *Liquidator* whose duties are similar to those of the trustee in bankruptcy. The liquidator may be nominated by the members of the company or in case of the company's insolvency by some or all of the creditors and the liquidator's appointment must be confirmed at a special meeting. If the winding up of an insolvent company takes more than a year, the liquidator must report annually to the Board of Trade, the Government Department which watches the interests of the persons concerned.

- 8 Adoption See D38-41
9 Legitimacy See D36-7

IV The CIVIL LAW or LAW OF PERSONS

This deals with the relations between one individual citizen and another, and their mutual rights and duties. If A makes a business agreement with B and breaks it, or if A walks without permission across B's field of new mown hay, B will be able to secure redress against A by proceedings in a court of law. But in neither case is it necessary for the State to intervene, by way of prosecution, to punish A for what he has done, since no offence against society at large and no violation of public order or the rule of law has arisen. The issue is one merely between A and B. B may choose to ignore the wrong done to him, or he may negotiate amicably with A for the payment of compensation, or if this fails, he may as plaintiff sue A as defendant in a civil action for damages. Unlike a criminal prosecution undertaken by the State for the preservation of public order and vindication of the rule of law, with a view to punishing the offender, the civil action will be brought if B so chooses, by B himself for the purpose of recovering compensation in money for the harm he has suffered and (in some cases) of obtaining an *injunction*—a Court Order prohibiting A from continuing his wrongful conduct. Again, a criminal prosecution will not be discontinued even at the request of the injured party, since the State itself is interested to see justice done, but a civil action can be discontinued by B at whatever stage he desires, with or without an agreement for the payment of damages in compensation.

These relations between one individual and another, interference with which may give rise to a civil action for damages or injunction, may arise in two alternative ways—from the acts of the parties themselves or from the operation of law. Hitherto evidence of a criminal conviction has not been admitted in civil cases, but this rule is abolished by the Civil Evidence Act 1968. The onus of proving that the conviction was wrong lies on the accused.

1 Law of Contract

The relations between individuals which arise from the acts of the parties themselves are usually brought about by a *contract*—i.e. by an agreement between them. A contract may be (a) expressed in words as where A agrees to buy B's motor-car for £400 on certain stated conditions or (b) implied by conduct as where A calls a taxi and tells the driver to take him to a certain address (a). In the former case, particularly if the contract is put into writing, the parties will normally have

expressed all the necessary terms and conditions. (b) In the latter case it is *implied* by A's conduct and understood by law and custom that A will be expected to pay at the end of the journey the amount of the fare recorded by the taximeter. It is not a necessary for the driver to stipulate those terms in advance. Everybody several times in the course of each day enters into an implied contract of this kind—when he steps on an omnibus to go to his work, when he orders a meal in a restaurant, when he tells the grocer to deliver goods to his house and so on.

Simple Contracts and Deeds

(1) A Simple Contract is a contract *expressed in words* (whether in writing or not) without the formalities of a *deed* (see below) or a contract *implied by conduct*. There is no legal contract (a) unless there is complete certainty on the terms, (b) unless the basis of the agreement is lawful, and (c) unless both parties are legally capable of entering into it (see above Status) and (d) in complete agreement on their intentions. And the agreement is not enforceable (e) unless there is some *consideration*, i.e. some *quid pro quo* expressed or implied on either side. (The Law Commission however is considering the abolition of *consideration* as essential to every contract.) Thus (a) a promise by A that he will buy B's motor car cannot be enforced by either side unless the price is mentioned, nor (b) if the car has been stolen by B, nor (c) if A is of unsound mind, nor (d) if B owns two cars and A is thinking of the Ford while B intends to sell the Austin. Again (e) a promise by C during the course of the year's work that he will give his employee D a Christmas box of £5 is not enforceable by D unless he has made a promise, or done something in return. If C tells D that he will give D the £5 at Christmas on condition that D puts in certain extra time over and above his normal working hours, and D complies or promises to comply, that compliance or promise of compliance will be sufficient consideration to turn A's promise into an enforceable contract. There need be nothing at all in writing, except in a few cases laid down by law, in all other cases the only value of a written agreement signed by both parties is that it provides clear evidence of the terms that were agreed. A written contract requires a sixpenny revenue stamp if it is to be produced as evidence in a court of law. (The Law Commission is recommending a code to cover the whole law of contract.)

(2) A Deed (broadly speaking) is a contract or other written document *signed, sealed and delivered* by the parties. The formalities of affixing one's seal to a legal document and pronouncing the formula, 'I deliver this as my act and deed', have emphasised the significance and solemnity of certain important transactions for many centuries past, and even persons who were unable to write their names were capable of carrying out the formalities of *sealing and delivery*. The legal requirement that deeds should also be *signed* was imposed only in 1926 by section 73 (1) of the Law of Property Act. The chief practical distinction between a simple contract and a deed is that a deed requires no consideration to make it enforceable. The special formalities which constitute the *execution* of a deed (i.e. signing, sealing and delivery) take the place of that moral obligation which (in a simple contract) the common law required to be satisfied by consideration on the part of the person to whom the promise was made. For this reason a deed is required in a case where A makes a promise to B which he desires to render enforceable without any corresponding promise by B to A, and also in a case where A desires to make to B a gift of property of such a nature that it cannot be physically handed over. This second case arises particularly where the subject of the gift is land or buildings, in fact, by a provision of the Law of Property Act 1925, a deed is always necessary to transfer the ownership of any freehold or leasehold property and also to grant a tenancy for a term of more than three years. The transfer of a legal right of some kind (e.g. a share in a company or the claim to moneys under an insurance policy) is generally effected by deed.

In connection with the Law of Contract the following subsidiary matters must be considered —

Subsidiary Matters

(a) *Capacity of Parties*—The question whether a party to a contract is legally capable of entering into it usually depends on that party's status (*see above*) —

(1) *Nationality*—Nothing turns on this except that no commercial contract can be made with an alien enemy in time of war

(2) *Domicil*—Where the two or more parties to a contract have their permanent homes in different countries it is a wise precaution for them to state in the contract under which country's law and by which country's courts in case of a dispute its terms are to be construed. If they omit to do so and some dispute is brought before the English Court it will endeavour to decide by considering the wording of the contract, the language in which it is written, the domicile of the parties and the general circumstances in which the contract was made, what legal system the parties intended to apply and by what court they intended to be judged. Sometimes it will decide the dispute according to the rules of the foreign law

(3) *Marriage and Divorce*—There is now no practical difference in contractual capacity between single persons, married persons and divorcees

(4) *Minority*—It is not (generally speaking) impossible for a minor to enter into a valid contract but he will be entitled to repudiate it at any time up to the date of his majority (or a reasonable period after that) unless the contract is (a) clearly for the minor's benefit on the whole (*e.g.* professional articles or an agreement for apprenticeship) or (b) for the provision of necessities—*i.e.* food, drink, clothing or services which are necessary to the minor in his particular station in life. (The origin of this latter rule is probably the practical consideration that in earlier times few people would have taken the risk of providing a minor on credit with the bare necessities of life if they had been precluded from suing him for reasonable payment.)

(5) *Lunacy*—A party to a contract who knows that the other party is of unsound mind will not be permitted to hold the latter to his bargain

(6) *Bankruptcy*—A bankrupt cannot make a valid agreement to deal with his property in a manner which contravenes the law of Bankruptcy

(7) *Corporations*—Whether a corporation is capable of entering into a particular contract depends upon the legal powers conferred by the Charter or Act of Parliament under which it was constituted or (if a company) by its Memorandum of Association. If the matter to which the contract relates is of grave importance it will usually signify its adherence to the contract by affixing its seal with the formalities laid down by its Rules or Articles of Association. If it is an everyday or trivial matter the corporation will normally enter into a contract through some agent (*e.g.* its Town Clerk, Director or Secretary as the case may be) who is empowered to sign or speak on its behalf

(8) and (9) Neither adoption nor legitimacy (or illegitimacy) affects a party's capacity to enter into a contract

(b) *When Writing is Necessary*—There are certain exceptions laid down by Act of Parliament to the rule that a contract is enforceable even if made only by word of mouth or implied by conduct. The Statute of Frauds 1677 provided that contracts of these exceptional kinds cannot be enforced by action in the Courts unless the agreement upon which such action shall be brought or some memorandum or note thereof shall be in writing and signed by the party to be

charged therewith or some other person thereunto by him lawfully authorised—these last words mean an *agent*. It is not necessary that the whole of the agreement shall be formally set down in writing but there must be a written and signed record of all the essential terms

(i) *A Guarantee*—*I.e.* a promise by A to B in the form—Please lend money (or supply goods) to C and if C does not pay you I will. A's promise by word of mouth cannot be enforced against him

This provision of the Statute of Frauds still holds good

(ii) *An agreement for the sale or disposition of land (or buildings)* or of any interest in land (or buildings). We have already stated that the actual transfer of a freehold or leasehold interest must be effected by deed. This is not the same as an agreement to sell or dispose of land or buildings. A *transfer* effects an immediate change of ownership while an *agreement to sell* binds the party who signs it to make a transfer of ownership at some future time. Such an agreement need not be in the form of a deed but its essential terms must be in writing

Some other parts of the Statute of Frauds have been repealed that contained in (ii) above has been replaced by a similar provision set out in section 40 of the Law of Property Act 1925

(iii) *A bill of exchange or promissory note* must be in writing by virtue of section 3 of the Bills of Exchange Act 1882

(iv) *A contract of Marine Insurance* is inadmissible in evidence unless it is embodied in a marine policy as laid down in the Marine Insurance Act 1906 sections 22–24 with all relevant conditions fully specified and duly signed by or on behalf of the insurer

(v) By the Contracts of Employment Act 1963 (in force since July 1964) it is the duty of an employer (not later than 13 weeks after the employment commenced) to hand his employee a written statement of particulars of the employment (period, wage, working hours and what length of notice is required for termination)

(c) *Mistake*—Suppose that John Brown wants his portrait painted by a famous artist called William Brush of whom he has heard but whom he has never met. He looks up William Brush in the directory and writes to him at the address shown offering him 100 guineas to paint the portrait. Suppose that particular William Brush is not the artist at all but a stockbroker of the same name. Even if that William Brush accepts Brown's offer their apparent agreement will not constitute a valid contract since Brown's mistake as to Brush's identity is so fundamental that it destroys the very basis of the agreement. Where there is a mistake of this kind going to the very root of the agreement no valid contract has in the eyes of the law been made. In other special cases equity may on the ground of conscience relieve one or both parties from liability under a concluded contract by *rectification* (*i.e.* by correcting the terms they have inadvertently recorded) or by *rescission* (*i.e.* by cancellation of the contract). It is not every mistake that will lead to these results: either the mistake must have been *fundamental* or the circumstances must have been such that it would be *unconscionable* for one party or the other to try to enforce his apparent rights

(d) *Misrepresentation*—Equity on similar grounds has often relieved a party from liability under a contract into which he has been induced to enter through a *representation* by the other party which is *substantially false*—*i.e.* a statement which is misleading on some essential point. Whether the misrepresentation was deliberate or innocent the deceived party will usually be able to have the contract set aside—*i.e.* cancelled

Suppose for example Jones wants to insure his life with the Markshare Insurance Company. Before issuing the policy which is the contract

between them the Company will ask Jones—Have you ever suffered from any serious illness? Suppose Jones says 'No' though he did in fact suffer from tuberculosis five years ago. Even if the policy contains a promise by the Company to pay Jones's widow £5000 upon Jones's death the Company will be entitled to refuse to pay when that event happens—it has been induced to enter into the contract through Jones's misrepresentation.

By the Misrepresentation Act 1967 if a person enters into a contract (later than April 1967 when the Act became law) after a misrepresentation has been made by the other party and (a) the misrepresentation has become a term of the contract or (b) the contract has been carried out or both then if under the old law he would have been entitled to rescind (i.e. cancel) the contract without alleging fraud he shall be entitled to do so in spite of (a) and (b). (Under the old law once the contract had been carried out his only remedy was damages if he had suffered loss.) It is now provided that where such misrepresentation has been made to a person as a result of which he has suffered loss then the other party shall be liable to damages even if there was no fraud (i.e. deliberate deceit) unless he proves that he believed on reasonable grounds up to the date of the contract that his representations were true. In any case the Court may award damages instead of or in addition to rescission if the Court thinks it equitable to do so whether the misrepresentation was innocent or fraudulent.

If an agreement is made containing a clause excluding or restricting liability for misrepresentation that clause shall be ineffective unless the Court thinks it fair and reasonable. In sales of goods rescission and/or damages are to be available to the buyer even after he has become the owner of the goods. And he is not deemed to have accepted them until he has been afforded and has had a reasonable opportunity of inspecting them to ascertain whether they conform to the contract or not.

(Note: This Act is expected to remove abuses particularly at some auction sales where the sellers in their catalogues have been reckless in attributing a work of art to a particular artist and have excluded liability for misdescription in the contract.)

(e) *Duress* means compulsion by threats or force. If a man has been compelled in this manner to put his name to a contract it is *voidable* by him at any time—i.e. he may repudiate it on the ground of duress and will be upheld by law in doing so. *Undue influence* means influence exerted by A upon B to such an extent that B could not have exercised any free and independent will in doing a particular act. Equity has always been jealous to protect certain classes of persons from this kind of influence—it goes so far as to presume that there has been undue influence where a guardian has got some benefit out of his ward, a parent from his child who is under (or only just over) majority, a doctor from his patient, a solicitor from his client or a priest from his parishioner. In most of such cases the onus is upon the person in the influential position who has obtained the benefit to prove that there was no undue influence. It is not for the other person to prove that his mind was wrongfully influenced by the former.

(f) *Illegality of contract* arises where the parties have agreed to do an act (i) forbidden by law or (ii) contrary to public policy. (i) The former includes not only an agreement to commit a crime but also an agreement to do an act which might be harmful to a third party and give him a right of action for breach of contract or tort. The courts will obviously not lend their assistance to a plaintiff who complains that the defendant has refused to honour his agreement to do some thing unlawful, whether (for example) the agreement was to burgle a house or merely to write a libellous article about another person. (ii) Even if the act agreed upon was not actually unlawful some courts will refuse to enforce the agreement if it was to do something which is regarded as harmful to the community. It is not for example a

crime for a man and a woman to live together without being married nor is it even unlawful in the civil sense that such a way of life gives the one a right of action against the other but no court would enforce an agreement by a woman to become a man's mistress nor an agreement by the man to maintain her in return.

(g) *Breach of Contract* occurs when one of the parties breaks his promise and neglects or refuses to perform his duty under the contract. Breach by one party entitles the other party to sue for damages—the amount of which is usually assessed so as to compensate the latter for the actual loss he has suffered. The object is to put the injured party so far as money can do it into the position he would have been in had the contract not been broken. From 1 January 1971 the Law Reform (Misc. Provisions) Act 1970 has abolished breach of promise suits.

(1) *Damages* have always been the common law remedy for breach of contract. In special cases however equity may grant two other remedies in addition to or in substitution for damages but only where equity regards damages as an insufficient compensation. These additional remedies are—

(2) *Specific Performance*—i.e. an order to the party in breach actually to carry out what he contracted to do. In practice this remedy is confined to (i) contracts for the sale or letting of land or buildings and (ii) contracts for the sale of some article of a special nature which cannot be replaced by spending money in the open market—for example the sale of an original painting by Rembrandt. The remedy of specific performance is never granted to enforce a contract for personal services since it would be impossible for the court to supervise the carrying out of such a contract.

(3) *Injunction*—i.e. an order by the court to the party in default prohibiting him from carrying out some positive act which would constitute a breach of contract. For example where a singer has entered into a contract to work for a certain period only under the management of one particular impresario and no other the court may order the singer not to offer or engage her services elsewhere during that period. Disobedience to an injunction constitutes *contempt of court* and is punishable by fine or imprisonment.

2 Law of Tort

This branch of the law deals with the relations between one individual citizen and another which arise from the operation of the law itself without the necessity for the parties to do any act to put them into legal relations with one another. As was pointed out above (D13(1)) if A and B are to be linked in a contractual relationship each of them must take some step to bring that relationship about. No such step however is necessary in connection with the matters dealt with by the Law of Tort. Everybody has a right to expect that his person and his property shall be inviolable by other private citizens—he also has a right to expect others to refrain from attacks upon his character and his business reputation. These rights do not arise from any agreement or other act on his part but from the general principles of the law.

A *tort* is the violation of such a right which entitles the injured party to bring a civil action for damages to compensate for the injury he has suffered. The word *tort* (in French *wrong*) is derived from the Latin *torus* meaning twisted or distorted.

It will be seen from the Table (D4) that some torts (e.g. assault) may also be crimes—that is they may entitle the injured party either to bring a civil action for damages or to prosecute the offending party and have him punished by a criminal court in cases where the offending party's action is liable to harm the community at large—a personal assault for example may lead in some circumstances to general disorder and in that event it will become a matter for intervention by

the State through the criminal courts (see D6). This section, however, deals only with the *civil remedies* which, as in breaches of contract, are primarily *damages* and sometimes *injunction*.

Trespass is a wrongful act committed by one citizen against the will of another citizen either against the latter's person or in disturbance of his possession of land or other property.

The Law Commission has made proposals for new legislation to make it a criminal offence to destroy or damage any property without lawful excuse, especially if that would endanger life or threaten to do such an act or to possess anything by which property could be destroyed or damaged (July 1970).

(1) Trespass against the Person may be by way of *assault*, *battery* or *false imprisonment*. An *assault* is an attempt to do violence to the person of another, if the act is fully consummated it becomes a *battery*. Thus it is an assault for one man to shake his fist in the face of another or to adopt a threatening attitude towards another or deliberately to set his dog on another person. If the first person actually strikes the other person or if the dog encouraged by the first person actually bites or harms the other person that is a *battery*. In order to constitute an assault or battery and to render the trespasser liable to an action for damages his act must be *deliberate*. It is not assault and battery if A accidentally knocks against B in a crowd with the result that B falls and is injured. The act by the trespasser must also be against the will of the person injured. Thus an operation performed by a surgeon though it may seriously affect the body of the other person is not an assault or battery if the other person has consented to the operation, but such an operation performed without the other person's consent may amount to an assault or battery.

Certain acts which would in the ordinary way constitute assault or battery are excusable: it is recognised for example by the common law that a parent or a teacher has the right to inflict reasonable chastisement upon a child or pupil in his care and provided that the chastisement is not excessive the child or pupil has no right of action. If however the chastisement results in serious injury or amounts to brutal violence then the person inflicting it will be liable to an action for damages. (The present Government is considering abolition of corporal punishment in schools).

False imprisonment means the *unlawful restraint* of one person by another. It need not amount to actually locking up a person in a room: it is sufficient if his freedom of movement is *totally restrained* either by confinement or by the use of force or threat of force. It should be noted that the restraint must be unlawful: it is not for example unlawful for a police officer to arrest a person engaged in committing a crime or a person whom the officer has reasonable grounds for suspecting of committing or being about to commit a violent crime. Even a private citizen may lawfully arrest a person who has actually committed a violent crime or whose behaviour has led to a breach of the peace (see D11(1)).

The tort of *malicious prosecution* is committed by a person who makes a criminal charge against another person where the proceedings terminate in the acquittal of the latter, where the first person was actuated by spite or ill will where there was no reasonable or proper cause for the proceedings and where the second person has suffered damage as a result. The essence of the tort is *malice* on the part of the person who brought the criminal charge: it is not sufficient that he was honestly mistaken.

(2) Trespass to Land arises whenever one person enters *unlawfully* upon land or a building in the possession of another person. Two important points should be noted, as several popular fallacies exist about this tort. First trespass to land is not in the ordinary case a crime unless there is some Act of Parliament which makes the trespass a criminal offence (for example under certain statutes it is a criminal offence for an unauthorised person to cross a railway line or to enter a Govern-

ment airfield from which considerations of security require unauthorised persons to be excluded). Secondly it is not necessary to constitute a trespass that actual damage should be done to the land or building on which the trespasser has set foot. The essence of the tort is interference with the possession of the other party and this may arise by merely walking across his field or throwing refuse upon it or placing or erecting anything on the land without the other party's consent: any act of physical interference suffices.

(3) Nuisance.—The tort of *nuisance* arises when an occupier of land or premises does something there which substantially interferes with the enjoyment by a neighbouring occupier of his land or premises. In trespass (see above) the interference must be physical: this is not so in cases of nuisance. For example it is a nuisance if A allows his factory chimney to emit volumes of thick smoke which drifts continually into B's house or garden or for A to carry on in a building belonging to him a trade or process which causes noxious smells or disturbing vibrations liable to interfere with B's enjoyment of his property. It is not however every such act that gives rise to an action for nuisance: there must be a certain amount of grave and false particularly in urban areas, but people must not use their premises in an unreasonable or wilfully annoying manner. Thus it has been held that a teacher of music who had pupils singing in her house for several hours a day and on several days a week which caused considerable disturbance to the person next door was not committing a nuisance since it was not unreasonable for her to use her house in this manner. On the other hand when the person next door retaliated by clashing domestic implements and deliberately making as much noise as possible while the lessons were going on he was held to have committed a nuisance because his conduct was unreasonable and wilfully annoying. But every case depends upon its own special facts. A building contractor who keeps a pneumatic drill going outside a private house in connection with building operations is not liable to an action for nuisance provided that the use of the drill is necessary to the work that it is confined to reasonable working hours and limited to a temporary period, but if the owner of a motor cycle were to keep its engine running merely to demonstrate its power outside his own garage for several hours a day and on several days a week his neighbours could claim that that was (in law) a nuisance. The Noise Abatement Act 1960 gives rights to local councils (on their own initiative or on complaint by three householders) to order reduction of unnecessary noise (including loudspeakers) in streets parks and gardens and to prosecute offenders.

All the above examples may be classed as *private nuisances* and they are torts but not crimes. There is however another class known as *public nuisances* which become criminal offences if they are liable to injure the public in general. Examples of these are leaving an unlighted obstruction on a public road blocking a public footpath or allowing a building to get into such a state of disrepair that it causes a danger to users of the public highway. In such cases the person causing the public nuisance may be prosecuted and punished, and moreover any individual citizen injured by such conduct may have a right to bring a civil action for damages.

(4) Trespass to Goods is an unlawful disturbance by A of B's lawful possession of his goods. Such disturbance may arise by seizure or removal of the goods without the owner's consent or by conduct causing damage to the goods. It follows that every theft of goods is also a trespass, but for the preservation of public morality it is laid down that if there is a criminal element in the conduct of the wrongdoer which makes his trespass theft the injured party cannot bring a civil action for damages unless the thief has first been prosecuted in a criminal court. The tort of *delictus* consists in the wrongful

detention by one person of another's goods and his failure or refusal to deliver them up when demanded.

The tort of *conversion* or *trotter* arises when A wrongfully appropriates the goods of B to his own use or to the use of another person depriving the owner of them permanently or for a substantial time or destroying them. These torts of *detinue* and *conversion* can be committed only against goods or articles of property they cannot arise from interference with fixtures permanently attached to a building growing crops or trees but these torts may be committed if after such things have been removed or cut down the wrongdoer detains or converts them to his own use.

(5) Negligence in law has a very specialised meaning it is not neglect or carelessness in the ordinary sense but failure to take such care as the circumstances of the particular case demand. In the tort of negligence there are two essential elements—first a *legal duty* to exercise proper care and secondly a *failure* to take such care. No action for negligence can be brought by A against B even if B has been grossly careless unless the relations between the parties were such that B was under that legal duty towards A. Moreover the degree of care which A is entitled to expect from B will vary according to the nature of those relations.

One obvious example where the legal duty of care arises is among persons using the roads. All of us have the right to use the roads for the purpose of travelling on foot or in some vehicle and the manner in which each of us exercises that right will obviously affect the safety and comfort of other road users. There is therefore a *legal duty of care* upon every road user (under the common law and quite apart from the provisions of Acts of Parliament relating to motor cars) to exercise his right to walk or drive with due regard to the similar rights of other road users. And equally obviously the *standard* or *degree of care* which it is reasonable to expect from the driver of a powerful car is higher than that which is expected from a pedestrian since the amount of damage which will be caused by carelessness on the part of the driver is very much greater than that which the pedestrian is capable of inflicting.

We are not here referring to offences under the Road Traffic Acts for which drivers or pedestrians may be prosecuted and punished under the criminal law. Careless or reckless driving or walking may be a criminal offence under those Acts even if it has caused no injury to any person or property. In cases where such injury has been caused the test to be applied in determining whether the injured person can sue and recover damages against the other party is whether that other party has fallen short of the standard of care reasonably to be expected from him. It is true that disobedience to a provision of the Road Traffic Acts or neglect of the Highway Code may constitute evidence helping to prove that the latter party was lacking in the proper standard of care required of him, but there may be other circumstances which show that he was negligent in law and liable to an action by the injured party for damages even though he committed no criminal offence.

There are many other relationships where the duty to take care arises. One of these is the relation between the occupier of premises and persons coming on to the premises whether they have a right to be there or not. Towards trespassers (see above) the duty of the occupier is merely a negative one—he must not set a trap. If he must not deliberately do anything calculated to cause injury nor must he do any act which if done carelessly is reasonably likely to cause injury. If he knows a trespasser is on the premises he must warn him before he does any dangerous act: the fact that the trespasser has no lawful right to be there does not entitle the occupier (for example) to weaken the supports of a bridge or set off an explosion without warning. If the occupier does so he will be liable to be sued for damages in an action for negligence even by a trespasser who is injured as a result. (The Law Commission has recommended that ownership or use of dangerous things dangerous activities

and damage by animals be penalised by civil action. Damages are to be assessed on a broader basis.)

The other rules relating to the duty of care owned by an occupier to persons coming on to his premises are now contained in the Occupier's Liability Act 1957.

The occupier's duty towards a trespasser remains unchanged. The Act however abolishes the former distinction between an *invitee* and a *licensee* both of whom it describes by the new term *visitor*. The principal rules are—

1 The occupier owes the same duty (the common duty of care) to all his visitors except in so far as he is free to and does extend, restrict, modify or exclude his duty to any visitor by agreement or other wise.

2 The common duty of care means a duty to take such care as in all the circumstances is *reasonable* to see that the visitor will be *reasonably safe* in using the premises for the purpose for which he is invited or permitted to be there.

There are subsidiary rules—e.g. that an occupier must expect children to be less careful than adults and that a person in the exercise of his calling (e.g. window cleaner) can be expected to appreciate and guard against special risks incidental to that calling. And a landlord of premises if he is under a legal obligation towards his tenant to keep the premises in repair is to owe to visitors the same duty as if the landlord were the occupier so far as concerns dangers arising from his default in carrying out that obligation. One of the matters recommended by the Law Commission is the creation of a right of redress for purchasers and visitors injured by defects in a building against vendors and landlords.

Among the classes of persons upon whom the law imposes a duty to take care are those who practise a profession or calling which from its nature demands some special skill, ability and experience. A man who is advised or treated by a physician, surgeon or dentist or who consults a lawyer or an architect is entitled to expect him both to possess and to exercise a reasonable degree of such skill, ability and experience. If the professional man falls short of the *proper standard* the patient or client may bring against him an action for damages on account of his negligence. But a mere error of judgment on a difficult point does not amount to negligence provided that the professional man possesses the proper standard of knowledge and skill and has used them carefully and conscientiously to the best of his ability. And he is not liable by virtue of his professional status, to an action of negligence for something he has done while acting otherwise than in his professional capacity—e.g. a solicitor who is asked to express an opinion on the value of a house (which is no part of his professional duty) (But a barrister cannot be sued for negligence in the conduct of a case in court.)

(6) Defamation.—The tort of *defamation* is committed by a person who attacks the reputation of another by publishing a false and defamatory statement concerning him to a third party. If the defamatory statement is in writing or some other permanent form (e.g. a picture, a film or a gramophone record) then the action will be for *libel*. If the defamatory statement is in spoken words or some other non permanent form (e.g. by signs or gestures) it will be *slander*.

Another important distinction must be observed at the outset. In cases of libel the person whose reputation has been attacked may sue for damages without proof of special damage—i.e. proof that he has suffered actual harm from the libellous statement, while in slander no action can normally be brought unless special damage can be proved. There are however five exceptional cases where such proof is unnecessary viz in slanders—

(a) disparaging a person in the way of his business, profession or office of profit (e.g.

saying of a doctor that he is ignorant of the first principles of medicine)

(b) imputing dishonesty to a person holding an office of honour (e.g. saying of a Councillor that he gives contacts to his friends)

(c) imputing that a person has committed a crime punishable by imprisonment (e.g. saying of a man he is no better than a thief)

(d) imputing that a person is suffering from a contagious disease of a disgraceful kind (especially a venereal disease)

(e) imputing unchastity to a woman or girl

In these five cases publication of the slander alone is sufficient to give rise to an action without proof of special damage for slanders of other kinds no action can be brought unless special damage can be proved.

Note also that no action can succeed either in libel or slander unless the statement complained of is (1) *false* and (2) *defamatory* and unless (3) there has been *publication* to a *third party*. (1) The statement must be false in substance and in fact if it is substantially true the person complaining has suffered no injury recognised by law to his right to the inviolacy of his reputation. (2) The statement must be defamatory—i.e. it must be one which tends to lower him in the estimation of right thinking members of the community or which is calculated to expose him to hatred, ridicule or contempt. (3) Publication in this context means simply making known the defamatory statement to at least one third party. If the defamatory statement is conveyed only to the person defamed and to no one else there is no publication and the person defamed has no civil remedy.

In one exceptional case—where a defamatory statement in writing is likely to lead to a breach of the peace—the person making it may be prosecuted for the offence of *criminal libel* for the purpose not of compensating the injured party but of upholding law and order (D91). In this exceptional case the *truth* of the statement (see above) is no defence and publication to a third party is not necessary to secure a conviction. But there is no such offence as criminal slander.

If a defamatory statement is made reflecting on a *class of persons* generally (e.g. an attack on Methodists or coloured people or money lenders) that will not entitle a person who happens to belong to that class to bring an action unless he can show that he *personally* was aimed at and defamed. (But under the Race Relations Act of 1965 it is now an offence to stir up hatred on the ground of colour.) The family of a deceased person cannot bring an action for a libel or slander upon the reputation of the deceased.

If the person sued puts forward the defence that the words he used were not published of and concerning the person bringing the action the question must be decided whether those to whom the statement was published could *reasonably understand* it to refer to him. If such understanding is reasonable then it is no defence for the person who made the statement to show that he did not in fact intend to refer to the other person or even that the latter's existence was unknown to him.

Some statements are defamatory in their *natural and primary sense* (e.g. John Brief is a thoroughly dishonest lawyer) others may appear unexceptionable if looked at literally but may have a defamatory meaning in a particular context or in particular circumstances known to the persons to whom they are published (e.g. I hear Mrs B has left her doctor a lot of money. A fine kind of doctor he is!). In cases of the latter kind the person who claims that the published words are defamatory of him must plead an *innuendo*—i.e. he must set out in his statement of claim the meaning in which he alleges the words complained of were used. It will be the duty of the judge to decide as a matter of *law* whether the words are *capable* of bearing that meaning; the jury will have to decide as a question of *fact* whether the words complained of did actually convey that meaning to those who heard or read

them. There are several recognised defences to actions of libel or slander—

(1) *Justification*—A plea that the words complained of were *substantially true*. Once the words have been shown to be defamatory it is for the person who used them to prove their truth—not for the party injured to prove them false.

(2) *Absolute Privilege*—By common law or by Act of Parliament defamatory words used on certain particular occasions though published to third parties cannot give rise to any right of action. The occasion is absolutely privileged. No party to any legal proceedings nor any witness counsel or member of the jury nor of course the judge can be called upon to answer for any words he has used during the proceedings however spiteful and however harmful they may have been to the reputation of any other person. The rule applies to *pleadings* (i.e. allegations in writing filed at the court) as well as to statements made in court by word of mouth.

Similar protection applies to words spoken in Parliament by a member of either House (though words spoken outside either House are not protected). And under the Parliamentary Papers Act 1840 those who publish (in the ordinary sense of the word) the proceedings of either House by its authority are protected in the same way so are official communications on affairs of State made by a minister to the Monarch or by one officer of State to another in the course of his official duty. To all these *absolute privilege* applies.

(3) *Qualified Privilege*—Apart from the cases just mentioned there are other occasions which are privileged not absolutely but in a qualified sense. The nature of the qualification will be explained below. Meanwhile it may be said that a privileged occasion of this latter kind arises whenever the person making a communication has an *interest* or a legal, social or moral *duty to make it* and the person to whom it is made has a corresponding interest or duty to *receive it*. A common example is a reference given about the character of a servant by a former to a prospective employer. Another is a report made on the commercial credit of a trader by one person who has dealt with him to another who intends to do so. Other occasions of qualified privilege are reports of judicial proceedings of public meetings and of the proceedings of municipal or other public bodies.

Such occasions are privileged to this extent and with this qualification—that there was no *malice* (i.e. spite or other *improper motive*) in the mind of the person when he made the communication. If there was malice then the fact that the occasion was one of qualified privilege will not protect him from an action for damages at the suit of the person defamed. In any such action it is the duty of the judge to decide as a question of *law* whether the occasion was one of qualified privilege; it is for the jury to decide as a matter of *fact* whether the defendant was malicious in what he wrote or spoke. (Contrast occasions of *absolute privilege* where the presence or absence of *malice* is *immaterial*.)

(4) *Fair Comment* on a matter of public interest.—This form of defence is most commonly employed by newspapermen, reviewers and critics. If this defence is to succeed the words to which it relates must be really *comment* (i.e. expressions of opinion not statements of fact) the comment must be concerned with a *matter of public interest* (e.g. a book, a play, a musical performance, a political speech) or the public actions of men in the public eye—but not their private lives). Lastly the comment must be *fair*—and it cannot be fair if it is actuated by *malice* in the mind of the commentator. If he has mingled with his comment some statement of *fact* and that statement is inaccurate or misleading that in itself will prevent the comment from being regarded as fair. The *onus* is on the defendant who is pleading fair comment to establish that what he is seeking to defend is really *comment* that the matter on which he commented was one of *public interest* (not, for example, private scandal) and that the comment is not based on any misstatement of facts or other

wise unfair Dishonest or insincere comment cannot be fair but on the other hand an honest belief in the commentator's mind that his comment was fair is not enough for a successful defence. The comment must be fair *in fact*.

The usual remedy in actions of libel and slander is damages—a sum of money sufficient (in the jury's view) to compensate a man for the harm his reputation has suffered. In certain rare cases the Court may in its discretion grant an injunction ordering the defendant not to publish or not to repeat the publication of a libel.

The Defamation Act 1952 reduced the risk of legal proceedings against anyone who *innocently* published a libel. The publisher may make an offer of *amends* i.e. an offer to publish a correction and apology and to take practicable steps to notify those who have received copies of any defamatory document. (a) If the offer is accepted and the promise performed the party defamed cannot bring or continue an action for libel or slander. (b) If the offer is rejected then the publisher in any action taken against him may plead in defence that the words were published innocently and that the offer of amends was made as soon as practicable. *Innocent* publication means (1) that the publisher did not intend the defamatory words to refer to the other party and knew of no reason why they might be understood to refer to him, or (2) that the words were not in themselves defamatory and that the publisher knew of no reason why they might be understood to defame the other party also that in either case the publisher exercised all reasonable care in regard to the publication.

V THE LAW OF PROPERTY

1 In General

(1) **Living Persons**—The special rights and disabilities which affect the ownership and disposal of property by certain classes of persons have been already dealt with under the heading of *Status* (D11-13). It is unnecessary to add anything here on the law of property in general so far as living persons are concerned but different rules are applicable (as will be seen below) to the ownership and disposal of land and buildings as compared with property of other kinds. The reason for this main distinction is that the former are in their nature immovable and cannot be physically transferred as can money and chattels (i.e. animals and tangible objects which are capable of being owned). In addition there is a third class—certain *intangible things* which can be owned and dealt with—for example the right to be paid a debt a share or stock in a company an insurance policy or a patent these are known as *things in action* and they can be transferred only in certain formal ways which will be described below.

(2) **Deceased Persons**—It is obvious that the law of any civilised community must make provision not only for the transfer by a living person of his property but also for the transmission of that property (his estate) upon his death. English Law permits every person who is not disqualified by minority or lunacy (D12(1)) to give directions during his lifetime as to the disposal of his estate upon his death. He can do this by means of a *will*. If he leaves no valid will he is said to die *intestate* and in that event the law itself lays down how his estate is to be distributed. A concise survey of the law governing the estates of deceased persons is given below. (Some of these rules have been modified so far as *domicil* is concerned by the Wills Act 1933.)

Wills and Intestacies—The law of wills is highly technical much trouble can be caused by a home made will and it is wise to seek a solicitor's advice. It is only possible here to outline the *formalities* necessary to make a valid will and the *procedure* to be adopted after a death. The rules stated are those under English law—applicable to England and Wales but not Scotland or Northern Ireland.

(1) **The Nature of a Will**—The person making a will—the *testator*—sets down how he wishes his property to be disposed of after his death and states the names of the persons (the *executors*) who are to attend to its disposal.

The executors may be but need not be some or all of the persons whom the testator desires to benefit under his will. One executor alone is sufficient in law but if that one dies before he (or she) has completed his duties delay and difficulty may arise. It is therefore better to appoint at least two executors. If one dies the other has full powers to continue the work. If the testator's estate (that is his property) is large it may be best to appoint a bank as executor. All banks have trustee departments which are experienced in such matters. They have scales of charges for executorship work which will be supplied on request. An executor is not permitted to charge for his work unless the will authorises him to do so—a thoughtful provision for a complicated estate. Nor is the executor bound to accept the executorship when death occurs.

A will speaks from death—that is it has no legal effect until the testator dies. It can be *revoked* (that is cancelled) in various ways or alterations can be made by *codicil* which is really a supplementary will. Further the property to which it relates is that of the testator at the date of his death which may be more or less than what he owns at the date when the will is made. The will can be revoked or varied as often as desired to suit changing circumstances. Its provisions are not final until death.

Generally speaking a testator may make whatever provisions in regard to his or her property and the persons to be benefited he or she thinks fit. He or she may even direct that his or her wife husband or children are to be deprived of all benefit from the estate but if he or she does so it will be well to give the reasons either in the will itself or in a signed witnessed and dated document which should be left with the will.

Under Acts of 1938 1952 1965 1966 and 1969 a husband or wife an unmarried daughter or son under majority or a son or daughter either natural or adopted under disability (that is one who for some reason is incapable of looking after himself or herself) who is not adequately provided for under the will may apply to the Court for reasonable provision for maintenance out of the estate. The Court has power either to refuse the application or to grant the applicant whatever maintenance it thinks fit. In making its decision the Court will take note of the testator's reasons for his failure to provide for the applicant in question. Similar rules now apply to former husbands and wives to the surviving spouse of a void marriage and to illegitimate children (see D36(1)).

If a person dies without leaving a valid will he is said to die *intestate*. In that case somebody (usually the husband or wife or next of kin) must apply to the Probate Registry (at Somerset House in London or in the nearest District Registry elsewhere) to be appointed *administrator*. An administrator has the same rights and duties as an executor. If there are children under majority and in certain other cases there must be at least two administrators and the procedure on death is more involved and troublesome than where executors have been appointed by will. Further as the testator has not directed what is to happen to his property the law has laid down an *order of succession* which the administrators must observe. The intestate's husband or wife is then entitled first to the *personal effects* (furniture household goods motor cars books etc.) next to the whole of the estate if there are no children or near relatives, or if there are and the estate is large enough the first £3750 and after that the husband or wife and children have certain rights in the remainder of the estate. If any details of which can be found in the Intestates Estates Act 1952 and the Family Provision Act 1966. If there is no husband or wife or no children or neither the next of kin of the intestate will benefit in order of nearness of their relationship to the deceased. By the Family Reform Act 1969, illegitimate children have the same rights to succeed to property on an intestacy as legitimate children.

It is always prudent to make a will however simple, since by doing so the testator exercises control over the disposal of his property and saves considerable trouble for his family.

(2) **The Execution of a Will**—The formalities must be strictly observed except in the case of soldiers, sailors and airmen on active service (including members of the Women's Services and Nurses) for whom informal directions even in a letter or by word of mouth are sufficient. For all other testators inattention to the formalities may render the will invalid and will in any case cause considerable trouble and expense.

The will must be in writing—i.e. not by word of mouth—handwritten, typewritten or printed, but the wording need not be in legal or formal language so long as it clearly identifies the testator, the executors, the various kinds of property dealt with and the persons to be benefited. It should also state the following formalities have been carried out when it was executed—that it is signed by the testator and attested—i.e. witnessed by two competent persons.

(a) The will must be signed by the testator or by some other person in his presence and by his direction. If the testator can write his usual signature will suffice if he is illiterate or too unwell to sign in full he may make his mark, or his initials alone. If he is incapable of holding a pen someone else may sign for the testator provided he is present at the time and authorises the signature. If the testator is blind or otherwise incapable of reading the will it should be read over to him before his signature or mark is placed on it, and the fact of his blindness should be mentioned in the final clause. *See also D12 end of (5)*

(b) The signature or mark must be at the foot or end of the will. This means (i) nothing added below the testator's signature and (ii) nothing written anywhere on the document after the testator himself has finished signing will be valid except the signatures, addresses and descriptions of the witnesses. If therefore at the last minute the testator desires some addition, alteration or deletion to be made he and the same witnesses must sign or put their initials against the addition, alteration or deletion which otherwise will be ignored.

(c) The testator's signature must be made or (if he cannot sign) acknowledged in the presence of two witnesses who must both be present at the same time. Any persons may be witnesses so long as they are capable of understanding what is going on. They need not read the will or know its contents, but if either of them is a person who is to take a benefit under the will or the husband or wife of such a person he or she will lose that benefit. It is therefore safest to call in witnesses who are strangers to the testator. Both witnesses must be present together when the testator signs (or acknowledges) his signature. It will not be a valid attestation if first one witness and then the other is called into the room.

(d) The witnesses must sign the will in the presence of the testator. Either witness may if necessary sign by mark or initial but no other person may sign on his behalf. For identification purposes it is usual and desirable for the witnesses to add their addresses and occupations in case of a subsequent dispute which may necessitate their being found to give evidence.

If the will consists of several pages they should be fastened together before execution and the signatures of the testator and witnesses should appear at the end of every page not to satisfy the rules set out above, but as evidence that every page formed part of the will when it was executed.

It is desirable (though not legally essential) that the will should bear just above the signatures of the witnesses an *attestation clause*—that is a formal statement that these formalities have been carried out. The usual wording of this clause will be found in the example shown below.

All these rules apply in exactly the same way

to a *codicil* which is a supplementary document amending the will in part *etc.* by adding a new legacy.

(3) **The Contents of a Will**—The opening words should clearly identify the testator by his full names, occupation or description, present address and (if possible) other recent addresses and declare that this is his *Last Will*. It is sometimes found at death that a testator has a banking account or stocks and shares registered in his name at some past address and in such cases the bank or company concerned wishing to be sure that his identity is clear may insist upon a sworn statement to the effect that he is the same person as the person they knew as customer or shareholder (*See example below*).

Next follows the *revocation clause*—a declaration that the will now being made *revokes* (that is cancels) all previous wills and codicils. If this is not inserted doubts may arise after death as to whether the new provisions are intended to be substituted for or merely to supplement provisions in an older will. If it is intended that the older will is to remain valid in part that should be clearly stated. If the document now being executed is a *codicil* it should be described as such and the date of the original will to which it is a codicil should be mentioned and also which parts of the original will are being *confirmed* to stand good and which *revoked*.

The next clause should appoint the executors who must be identified by their full names and descriptions or addresses. My brother John, my son Charles or my mother will suffice since only one person could possibly answer to any of these descriptions but my wife is not enough without giving her names in full since it does not follow that the person who is the testator's wife at the time of his death was necessarily his wife when the will was made.

Next follow the directions for disposal of the testator's property. *Bequests or legacies* of particular articles (my pearl necklace, my oak bedroom suite) or of particular investments (my 3% War Stock)—these are *specific legacies*—must clearly identify exactly what is being bequeathed. In the case of land or a house the full description should be given—my leasehold house and grounds at 81 Acacia Road Redhill in the County of Surrey or my freehold farm known as Newlands at Northgate in the County of Derby. The words I devise are the technical words appropriate to freeholds. I bequeath to all other kinds of property the effect is the same. (*Bequests or legacies of sums of money—pecuniary legacies—should preferably be stated in words rather than figures if figures are used the accidental omission of a nought may be disastrous*).

Finally there is the clause that deals with the *residue* of the Estate—that is to say whatever will remain after the executors have paid the funeral expenses, death duties (if any) legal and other fees, the testator's debts and the pecuniary legacies he has bequeathed and after the specific bequests have been handed over to those entitled. Such a clause is necessary because no testator can be sure when he makes his will that he has disposed exactly of everything of which he may die possessed or that all the persons to whom he has made bequests will necessarily be alive when he dies. In general the death of such a person—a *legatee*—before the testator causes that person's legacy to lapse but if there is a bequest of the residue for division among a number of persons no harm is done the *lapsed legacy* being left over and undisposed of leaves the residue to be divided among the surviving *residuary legatees*. The expression such of the following persons who may survive me may be properly used.

At the time of writing (Nov 1970) a Committee is considering the possible relaxation of some of these strict rules.

(4) **Revocation and Revival**—A will or codicil may be *revoked* (i.e. cancelled) by burning, tearing or otherwise destroying it with the intention of revoking. Destruction by accident or without the testator's desire to revoke it is in

effective and if a copy exists its provisions may be put forward as still valid. The revocation clause in a later will (*see above*) will be equally effective to revoke an earlier will or some part of the earlier will may be revoked by a later codicil clearly referring to that part.

A will is also revoked—generally speaking—by subsequent marriage since the law assumes that if the testator who is newly married had had time for or given thought to the matter he would have altered his will. If he did not do so after marriage he will die intestate.

If a testator makes Will A and later on Will B containing a revocation clause Will A is revoked—*i.e.* cancelled. But if Will B is in turn revoked by Will C that does not *revoke—i.e.* revalidate—Will A unless Will C says in so many words that Will A is hereby revived.

By the Act of 1969 (D19(2)) the words child children in a will include illegitimate as well as legitimate children (unless otherwise stated).

¹⁴ SIGNED AND ACKNOWLEDGED }
by the above named JOHN SMITH }
the Testator as and for his LAST WILL }
in the presence of us both present at }
the same time who at his request in }
his presence and in the presence of }
each other have hereunto subscribed }
our names as witnesses }

John
Smith

George Matthews
6 Elm Road
Redhill Surrey

Chauffeur

Ida Gray
10 Oaktree Road
Redhill Surrey

Children's Nurse

¹ Profession is usually inserted for identification purposes

² Revocation Clause—cancels all previous wills and codicils

³ Testamentary documents —includes both wills and codicils

⁴ Wife's name should be mentioned—he may have a different wife by the time he dies

⁵ In fee simple —technical words showing that the entire freehold interest is disposed of

⁶ Specific legacies —*i.e.* legacies of actually specified things

⁷ Not my motor car he may sell his present car before he dies and perhaps buy a new one in which case there might be a dispute as to whether he meant only the car he owned at the date of his will

⁸ This expression is defined in the Administration of Estates Act 1925. It includes furniture plate china wines cigars books and other personal effects. It is better to use a word clearly defined by Act of Parliament than a vague word like possessions

⁹ *i.e.* all personal effects which the Testator has not left or will not leave to anybody else

¹⁰ These words show clearly that although the wife is one of the Executors with the duty of clearing up the estate for the benefit of all the persons to be benefited these particular bequests are for her own personal benefit

¹¹ Pecuniary —*i.e.* money

¹² Residue —everything left after all the other gifts have been disposed of and debts paid

¹³ Charging Clause without which the Executor who is a solicitor would not be able to charge for his work on the Estate

¹⁴ This is the proper form of attestation clause—*i.e.* the clause showing that the proper formalities for signing and witnessing were observed

SPECIMEN WILL

I JOHN SMITH of 31 Acacia Road Redhill in the County of Surrey Company Director¹ HEREBY REVOKE² all wills and testamentary documents³ heretofore made by me AND DECLARE this to be my LAST WILL

1 I APPOINT my wife JANE SMITH⁴ and my Solicitor EDWARD JONES to be jointly the Executors of this my Will

2 I DEVISE my freehold farm known as Newlands situate at Northgate in the County of Derby unto my son JAMES SMITH in fee simple⁵

3 I BEQUEATH the following specific legacies⁶

(1) To my son THOMAS SMITH my motor car of which I may be the owner⁷ at the date of my death

(2) To my said son JAMES SMITH all my shares in the Company known as John Smith & Sons Limited

(3) To my said wife all my personal chattels⁸ not hereby or by any codicil hereto otherwise bequeathed⁹ for her own absolute use and benefit¹⁰

(4) I BEQUEATH the following pecuniary¹¹ legacies

(1) To my daughter JULIA SMITH the sum of TWO THOUSAND POUNDS

(2) To my secretary EVELYN ROBINSON the sum of ONE HUNDRED POUNDS

5 I DEVISE AND BEQUEATH all the residue¹² of my real and personal estate whatsoever and wheresoever not hereby disposed of as to my freeholds in fee simple⁶ and as to my personal estate absolutely unto my said wife JANE SMITH for her own absolute use and benefit¹⁰

6 I DIRECT that any executor of this my Will being a Solicitor or a person engaged in any profession or business may be so employed and act and shall be entitled to make all proper professional charges¹³ for any work done by him or his firm in connection with my Estate including work which an executor not being a Solicitor or a person engaged as aforesaid could have done personally

IN WITNESS whereof I the said JOHN SMITH the Testator have to this my LAST WILL set my hand this twelfth day of April One Thousand Nine Hundred and Seventy

Probate and Letters of Administration—It is a peculiarity of the English system that a deceased person's estate upon his death does not vest in *i.e.* fall into the possession of the persons to whom he has left it by will or among whom it has by law to be distributed (the beneficiaries) the estate vests in the first instance in his executor or executors if he has appointed any such. (If he has made no such appointment then pending the appointment of administrator or administrators (D19(3)) the estate vests (for the time being) in the Presiding Judge of the Family Division of the High Court of Justice, that Judge has no duties in relation to the estate but any notices that would, if there were executors

have to be served upon them must be served for the time being upon him.) The generic name that applies both to executors and administrators when their title has been lawfully recognised is *legal personal representatives* that is to say they are recognised by law as representing the deceased person for all purposes under the law of property and for most purposes under the law of contract and the law of tort. Generally speaking the deceased person's rights and liabilities are transmitted to his legal personal representatives and can be enforced by or against them as soon as they have taken out a grant of probate or of letters of administration. (Small estates are dealt with more simply.)

The grant in either case is a document issued by one of the Registrars and bearing the seal of the Family Division of the High Court and the signature of one of its Registrars. It states the deceased's name and address, the date and place of his death and either (1) that his last will has been proved and registered in the Registry concerned or (2) that he died intestate (as the case may be), that (in the former case) the executors or (in the latter case) the administrators whose names, addresses and descriptions are given are entitled to administer (i.e. to deal with) all the estate which vests in them by law and the document concludes by certifying that an Inland Revenue Affidavit has been delivered showing the gross and net values of the estate and the amount of estate duty and interest (if any) paid. Where a will has been proved a photostat copy of the will is bound up inside the grant. If no will has been proved the grant consists of a single sheet bearing the above mentioned particulars. It is important to note that in either case the title of the legal personal representatives (i.e. their legal right to deal with the estate) is evidenced by the grant — i.e. the document by which the Court's authority is conferred upon them — and not directly by the terms of the will or by their relationship (if any) to the deceased. Anybody for example who is purchasing property of the deceased from the legal personal representatives is required only to satisfy himself that probate or letters of administration have been granted to them, such a purchaser is not in the least concerned with the terms of the will.

Whenever any *formal transaction* has to be carried out in connection with the deceased person's estate the grant must be produced. This applies in particular to dealings with land or buildings, things in action (see D27(2)), the institution of defence or continuation of legal proceedings for the benefit of the estate and the transfer of the deceased's contractual rights. There are however a number of *informal acts* which the persons (if any) appointed by the will to be executors or the nearest relatives who intend to apply for letters of administration may properly do before the issue of the grant. These include such common sense matters as arranging the funeral, safeguarding and insuring documents and valuables, feeding livestock, locking up premises and preserving property which would deteriorate if neglected. All persons should however take care not to sell or dispose of any part of the estate before the grant is issued, a person who without lawful authority meddles with the estate may find himself regarded as *executor de son tort* — i.e. placed in the position of an executor by his own wrongdoing — and thereby bound to meet the liabilities of the deceased person and pay the death duties (if any) for which he ought to have provided. Even a person named in the will as executor takes a risk if he does more than the most urgently necessary acts before probate since it may turn out that that will is for some technical reason invalid or some later will may come to light in which he is not named.

Not more than four persons can apply for a grant of probate or letters of administration. If therefore the will names more than four executors the persons named will have to decide among themselves which of them are to apply. Even if there are no more than four, none of them is compelled to apply unless he has already meddled with the estate. He can renounce his right by signing a form of renunciation. If the deceased has appointed no executor by will one or more (not exceeding four) of the next of kin can apply

for letters of administration. Apart from the special cases (D19(2)) in which there must be at least two administrators no grant will be made to any more distant relative of the deceased unless and until all nearer relatives have renounced their rights or been cleared off. This last expression means that it must be clearly shown that they are dead or for some other reason are incapable of acting as administrators. (The order of priority among the relatives entitled to take out a grant is (1) husband or wife (2) children and their remoter issue (i.e. grandchildren, great grandchildren, etc.) (3) parents (4) brothers and sisters and issue of deceased brothers and sisters (5) half brothers and half sisters and issue of deceased half brothers and half sisters (6) grandparents and so forth.)

It has been said above that the property of a deceased person vests on his death in his executor or executors if any; if there are no executors it vests in his administrators as soon as they have been duly constituted as such by the grant. In law these legal personal representatives (executors or administrators) have the same powers of disposing of the deceased's property as if they were the owners of that property in the fullest sense but in accordance with the rules of equity (see D7) they must exercise their powers of disposal strictly in accordance with what is *just and conscionable* — i.e. they must distribute the property itself or sell it and distribute the net proceeds as laid down by the terms of the will (if any) in case of an intestacy as laid down by the law of succession as set out in the Intestates' Estates Act 1952 and the Family Provision Act 1966. That strict exercise of their powers which conscience demands will be enforced in case of need by the Chancery Division of the High Court of Justice (see D8) at the suit of any beneficiary under the will or intestacy. But purchasers and persons other than the beneficiaries can safely deal with the legal personal representatives as though they were legal owners of the deceased's property provided the grant is produced as evidence of their powers.

The procedure in applying for a grant of probate or letters of administration is that the applicants must make a valuation of the various kinds of property of which the estate consists, the value of each item is to be the value on the date of death. (It is not usually necessary to employ a licensed valuer though this may be helpful if the estate includes valuable jewellery, antiques or works of art.) An *Inland Revenue Affidavit* for death duty purposes must be completed and sworn before a Commissioner for Oaths. This document is one of a number of printed forms (varying according to the nature and composition of the estate and obtainable from Somerset House, the Estate Duty Office and certain principal post offices). It is divided into headed columns showing (a) the descriptions and the values of the various parts of the estate (e.g. cash at bank, Government securities, stocks and shares, furniture and effects and so forth); a separate section shows (b) the funeral expenses and the debts which the deceased left owing. The *gross estate* consists of the items under (a); the *net estate* is calculated by deducting those under (b) from the gross total (the cost of a tombstone cannot be deducted).

In the simplest cases estate duty is payable on the net estate according to a sliding scale, but no duty is payable on an estate of £10,000 or less. (In all but the simplest cases it would be wise to consult a solicitor as the law relating to estate duty is excessively complicated.)

Another part of the document sets out particulars of the deceased and of the applicants and the kind of grant required. The document when sworn must be forwarded to the Estate Duty Office who will assess the duty payable (if any) and interest on such duty from the date of death. This must be paid in full before proceeding further except the part of the duty that relates to freehold property which may be paid by instalments. (The deceased's bank will usually grant a loan or overdraft for the purpose of such payment.) When the duty has been paid the Inland Revenue Affidavit will be returned to the applicants receipted.

The second document required is the *Form of*

Oath for Executors or Administrators This gives particulars of the deceased and of the applicants as before and declares either (a) that they believe the paper writing before them to be the deceased's last will or (b) that the deceased died intestate in either case they declare their relationship (if any) to the deceased and the capacity in which they apply (e.g. the executors named in the will or the lawful widow of the deceased or as the case may be) and they swear to administer the estate (the gross amount of which they mention) according to law and to produce proper accounts whenever called upon to do so. This Oath must also be sworn before a Commissioner.

If there is a will it must now be signed (for identification purposes) by the applicants and the Commissioner for Oaths. If there is no will a third document is required known as an *Administration Bond*. This is a printed form which must be completed and signed sealed and delivered (see D13(2)) by the applicants and two *sureties*—i.e. independent persons who are willing to guarantee that the applicants will carry out their duties according to law under the penalty of forfeiting double the value of the estate if there is any default. (In practice an insurance company will usually undertake the duty of surety for a reasonable premium, and in that event no other surety is required.) The Bond must be executed (i.e. signed sealed and delivered by the individual sureties or sealed by the insurance company and also signed sealed and delivered by the applicants) before a Commissioner for Oaths.

Finally the applicants must take to the Principal Registry of the Family Division at Somerset House or to one of the District Registries outside London (a) the receipted Inland Revenue Affidavit (b) the duly sworn Oath for Executors or Administrators (c) either the will (if any) duly marked with the signatures of the applicants and the Commissioner or the Administration Bond duly executed. If there is no hitch the grant of probate or letters of administration will usually be posted to the applicants (or their solicitor) within about fourteen days.

(For the convenience of persons who have no legal adviser there is a Personal Applications Department situated in Bush House Aldwych W.C.2 where the officials are extremely helpful in answering questions and showing applicants how to complete the forms. But in most cases trouble and delay will be avoided by employing a solicitor.)

II Property in Land (Immoveable Property)

Although the *logical distinction* preserved in the legal systems of other countries is between property in land and buildings and property of other kinds (Immoveables and moveables) English law has from an early date made the more artificial distinction between *real property* or *realty* (i.e. freeholds) and *personal property* or *personalty* (i.e. leasehold land and property of all other kinds). The reason is historical. In early times if the possession of freehold land was withheld from its rightful owner his remedy was an action for recovery of the actual thing withheld—i.e. the freehold land itself—and that very thing (in Latin *res*) would be restored to the owner under an order of the Court. On the other hand when property of other kinds (including leaseholds) was withheld from its rightful owner his remedy was an action against the wrongdoer in which the remedy would be the award of damages against the wrongdoer personally (*in personam*)—not an order for the restoration of the actual goods or other property withheld. Although that distinction in the remedies is no longer generally applicable the terms (realty and personalty) have been retained.

1 Realty or Freehold Property—The difficulties of this branch of the law are due principally to historical reasons which go back to the Feudal System. In a very practical sense that System recognised only the Monarch as the *owner* of land those who held it from him were *tenants* (in French holders). If the tenancy was one

which was not limited to expire at the end of a fixed period it was known as an estate in fee simple—i.e. a *freehold*—a tenancy which was for a fixed period only was known as a term of years absolute or a *leasehold*.

When the Feudal System came to an end this distinction remained. A freehold estate in land is still an interest which has no fixed expiry date and the freeholder out of that unlimited interest can carve as it were fixed leasehold terms during which tenants will hold the land of him.

The property legislation of 1925 profoundly changed and simplified the law. Until the end of 1925 one important characteristic of the freehold estate was that of *primogeniture*—the rule that on the death of the freeholder intestate the freehold passed intact to his eldest son or (if he left no son) to his eldest male heir. This was abolished by the Administration of Estates Act 1925 which enacted that in the event of a person's dying intestate after 31 December 1925 the whole of his property (realty as well as personalty) should devolve upon his legal personal representatives (D22(1)) and that it should as one whole be sold and converted into money so far as necessary for the payment of the deceased's funeral expenses and debts death duties administration expenses and for distribution among his next of kin. The eldest son or heir has no longer any special privilege.

Settlements—On the other hand a freeholder (whom we will call Charles) having a freehold estate in land—i.e. an interest which has no expiry date—can during his lifetime create successive interests to take effect one by one. Charles can if he so desires settle his freehold estate to be enjoyed by himself during his lifetime after his own death by his eldest son George during that son's lifetime then by his second son John during John's lifetime and finally by George's son Peter in fee simple. The successive interests of Charles, George and John are called *life interests* the ultimate future freehold interest reserved for Peter to enjoy after the deaths of his grandfather his father and his uncle is called a *remainder*. Both the life interests and the remainder are *rights of property* to which Charles, George, John and Peter become entitled immediately the settlement is made—that is they are present rights to the future enjoyment of the property and those rights can be dealt with at any time even before they fall into possession. Since Charles, George and John must some time die Peter knows now that his freehold remainder must come some time to him or his personal representatives and through them to his next of kin (see above) for even if he dies young while George and John are still alive his right will not be defeated but will be preserved for those to whom his property may eventually pass under his will or intestacy. Therefore that *present right to future enjoyment* is a piece of property which Peter can deal with now unless he is a minor or unless he is restricted by the terms of the settlement from doing so. George and John can if they are so minded do the same with their life interests—that is they can now sell to another person for hard cash their present rights of future enjoyment or they can mortgage (i.e. pledge) those rights against a loan on the understanding that they will get back those rights when the loan is repaid.

To watch over these successive interests and to preserve the rights of the ultimate successor Charles appoints *trustees* of the settlement whose duty it is to act impartially by all the beneficiaries. A trust corporation (usually one of the bank trustee companies) which never dies or at least two individuals may act as trustees. The Trustee Act 1925 provides for the appointment by a simple procedure of new trustees to take the place of those who die become unfit or unwilling to go on acting etc. In the last resort the Chancery Division of the High Court (the guardian of equity) has power to make such an appointment for equity never lacks a trustee.

In order to enable landed property to be freely disposed of it is provided by the Settled Land Act 1925 that the person who is for the time being enjoying the current life interest (see above) has power to sell the entire freehold estate if he so desires. Nevertheless the scheme of interests

under the settlement is not defeated for the purchaser from the tenant for life must pay the purchase money not to him but to the trustees they must invest the money in safe investments and carry out the provisions of the trust with the necessary modifications. Each tenant for life will then receive the interest or dividends on the investments during his lifetime just as formerly he would have received the rents and profits of the land during his lifetime while the remainderman (Peter) will ultimately come into the capital of the trust fund (i.e. the investments themselves) in the form of the freehold interest. (By the terms of a 1961 Act half the investments may consist of stocks or shares in commercial concerns recommended by a stockbroker or other competent adviser.)

2 Leaseholds.—We have seen above that the freeholder out of his estate which is unlimited in time can carve fixed terms of years absolute or leasehold estates. These terms may be of any length the most common are terms of 999 and 99 years. The document by which such a term is granted is called a lease the person granting the term is the landlord or lessor the person to whom it is granted is the tenant or lessee. But the lessor by the grant of a lease has not given up all interest in the land. The lessor's freehold estate is unlimited in time when therefore the leasehold term (however long) comes to an end the right to possession and enjoyment of the land will revert to the freeholder. That right known as a reversion is again a present right to future enjoyment and as such a piece of property which the freeholder can if he wishes dispose of now.

The sale of a reversion is in fact equivalent to the sale of the freehold subject to an existing lease it confers upon the purchaser the lessor's right to receive rent from the lessee throughout the leasehold term and at the expiration of that term to repossess and enjoy the land without limit of time.

The lessee has a legal estate in the land for a fixed term of years and he in turn (unless prohibited by the provisions of his lease) can grant sub terms to expire at any time before his own head term. This is a process which can be repeated in turn by each lessee underlessee sub underlessee and so forth who will become respectively the underlessor sub underlessor and so forth of the person to whom the next subordinate interest is granted. Thus Michael the freeholder by granting to James a term of 999 years leaves himself with a freehold reversion which will revert at the expiration of the 999 years into the possession of the then freeholder. James by the grant of an underlease can carve (out of his leasehold term of 999 years) a sub term of 99 years in favour of William whose underlessor or landlord he becomes leaving himself with a leasehold reversion of 900 years. William in his turn can grant to Anne a sub underlease for 21 years leaving himself a leasehold reversion of 78 years and so forth. The relationship of lessor and William and Anne James and William Michael and James this relationship is one of privity of estate as well as privity of contract. The former phrase means that each of these pairs of individuals is linked by their mutual interest in the same term of years as above described. The latter phrase privity of contract means that the link is contractual—it arises from the agreement between Michael and James contained in the headlease the agreement in the underlease between James and William and that in the sub underlease between William and Anne. But between Anne and James between William and Michael there is no relationship of any kind neither of contract nor of estate. Michael can look only to James James to William and William to Anne to carry out the terms of the respective tenancies.

In certain circumstances however there may be privity of estate between two parties without privity of contract. Suppose Michael conveys (i.e. transfers) his freehold reversion during the subsistence of James's lease to Robert. Thereby Robert will take over all Michael's rights as lessor as well as being entitled to possession of the freehold when James's lease expires. Between Robert and James there will be privity

of estate arising from their mutual interest in the term of 999 years (as lessor and lessee respectively) but there is between them no privity of contract for Robert and James have made no agreement with one another. The distinction may in certain circumstances be important.

The Form and Contents of a Lease.—A lease for a term of more than three years must be made by deed (D13(2)) between the lessor and the lessee. It names and describes the parties and sets forth that in return for an annual rent (and sometimes on payment in addition of a lump sum called a premium) the lessor demises (i.e. lets) to the lessee for a term of so many years from such and such a date the land in question with the buildings erected thereon. (In the law of property the buildings go with the land on which they stand.) Then follow the *lessee's covenants*—the promises which he is to perform. To pay the rent by stipulated instalments on certain dates to pay rates taxes and other outgoings on the property to put and keep the property in full repair to paint the inside and the outside of the buildings at stated times to keep the property insured to its full value in the names of the lessor and himself to permit the lessor periodically to inspect the condition of the property to carry out repairs which the lessor as a result of such inspections may call upon him to carry out. These are some of the *stock clauses* but every individual lease must be carefully studied in order to ascertain what the lessee's obligations are.

Next come the *lessor's covenants*—the promises which the lessor is to perform. The chief of these is that if the lessee carries out his part of the bargain the lessor will permit him quiet enjoyment of the property without disturbance during the term. Some leases also contain stipulations binding on both parties for example a stipulation that the rent shall be reduced or suspended if the property is damaged or destroyed by fire and sometimes an arbitration clause. At the end of most leases comes a *proviso* for the protection of the lessor to the effect that he shall be entitled to expel the lessee and to re-enter and repossess the property if the lessee ceases to pay his rent or to perform his covenants as required or in the event of the lessee's bankruptcy. (But he cannot do so without leave of a Court.)

One copy of the lease (the *original*) is signed sealed and delivered (D13(2)) by the lessor and handed over to the lessee as evidence of his title to the leasehold interest. The other copy (the *counterpart*) is signed sealed and delivered by the lessee and handed over to the lessor as evidence of his entitlement to the rent and to the performance of the covenants by the lessee. The counterpart requires a stamp (impressed by the Stamp Duty Branch of the Inland Revenue) of only five shillings but the original must be stamped at the rate of 6s for every £50 of the rent in leases not exceeding 7 years (and at higher rates in longer leases) if the rent exceeds £50 10s per £50 of any premium is payable also. No stamp duty is payable on rents up to £100 in short leases.

3 Statutory Reforms in Law of Landlord and Tenant.—The above text on Leaseholds and Leases sets out the common law rules. But at various times since 1920 Parliament has considerably amended and added to those rules—particularly to protect (1) tenants of trade business and professional premises and (2) tenants of dwellings of comparatively low rateable value.

1 Business Tenancies.—Under the Landlord and Tenant Act 1954 Part II (and cases decided under it) as amended by the Law of Property Act 1969 security of tenure is granted (under certain conditions) to a lessee or underlessee who occupies premises for the purpose of a trade business profession or employment carried on by him on the premises. (We shall refer to such premises as the holding.) The holding may not be used as business premises and there is no security if the lease or tenancy agreement prohibits their use as such unless permission has been given by the lessee's (or underlessee's) landlord to that effect. Tenancies excluded from protection include agri-

cultural holding—mining leases on licensed premises (except certain hotels and restaurants) and tenancies not exceeding six months unless the tenant and the person who carried on the same business there before him have occupied the premises for more than twelve months altogether.

A holding is protected by the Act by the provision that the tenancy does not automatically come to an end on the date specified in the original lease, but only (i) if the landlord gives to the tenant not less than six nor more than twelve months notice in writing to terminate the tenancy (ii) if the tenant gives to the landlord within a similar period a request for a new tenancy (iii) where the tenancy is for a fixed period if the tenant gives at least three months notice (expiring at the end of the period or on any quarter day afterwards) that he does not want the tenancy continued (iv) if it is a periodic tenancy (from month to month or year to year) the tenant gives the landlord notice to quit of the full legal length (v) if the tenancy is surrendered or (vi) if the tenancy is forfeited (which can be done by the landlord only on a Court application). In cases (i) and (ii) the parties may agree to fresh terms for a new tenancy. It is vital in such cases that the time table laid down in the Act shall be adhered to and the advice of a solicitor should be sought at least twelve months before the end of the lease. If any request or application is out of time the Court cannot help the party in question. The twelve months or six months notice of termination must not expire earlier than the date of expiry of the original lease.

Where (i) the landlord serves the notice of termination (a) it must require the tenant within two months of the notice being given to notify the landlord whether or not he is willing to give up possession on the specified date (b) it must state whether or not the landlord will oppose an application to the Court for a new tenancy and if so on what grounds. Four of the grounds are that the tenant has neglected repairs or payment of rent for which he is liable or committed some other breach of his lease or that the landlord has offered reasonable alternative accommodation. Three further grounds are (c) that the existing tenancy is an underlease of part of premises held under the headlease and the separate lettings would produce a lower total rent than if the whole were let together (f) that on the termination of the current tenancy the landlord intends to demolish or reconstruct the holding or a substantial part and could not reasonably do so without obtaining possession of the whole (but not if the tenant is willing to give the landlord access to do the work or to accept a new tenancy of part of the holding (g) finally that on the termination of the current tenancy the landlord intends to occupy the holding for the purposes of a business to be carried on by him or as his residence. (But the landlord may not oppose the grant of a new lease on this final ground if his interest was purchased or created within five years immediately preceding the termination of the lease.)

If the tenant prefers to request a new tenancy he must propose not more than twelve nor less than six months from the date of request, but not earlier than the date of expiry of his existing lease. The tenant must also propose the period of the new lease the rent he is willing to pay and the other particulars of the proposed new tenancy. The tenant cannot make such request (a) if the landlord has already served a termination notice or (b) if the tenant has served notice to quit nor can either (a) or (b) take place after the tenant's request for a new tenancy.

Within two months after a tenant's request the landlord must serve on the tenant notice stating on which of the above grounds (if any) he will oppose the Court's grant of a new tenancy. The parties cannot make any agreement to the effect that the Act shall not apply without the court's leave at the time the tenancy was granted.

The next step is for the tenant not less than two months nor more than four months after the landlord's termination notice or the tenant's request for a new tenancy to apply to the County Court which must grant him a new tenancy on such terms as the parties may agree on or the Court thinks fit unless the landlord establishes any of the above grounds of objection. If the landlord's objections are false the Court will grant the tenant damages.

If the landlord establishes any of grounds (e)

(f) or (g) so that the Court cannot grant a new tenancy the Court orders the landlord to pay to the tenant compensation for disturbance or the parties may agree on the amount of compensation without Court action. If the tenant has carried on business on the holding for the whole of fourteen years preceding the termination the compensation is twice the net rateable value. If for a lesser period a sum equal to the rateable value.

If the above procedure is carried out the old tenancy continues in effect until the final disposal of the case even if the lease has expired meanwhile but a fair rent may be fixed by the Court for the interim period of the proceedings. Final disposal includes any necessary time for appeal.

2 Residential Tenancies—The Rent Acts 1965-68 as partially amended by the Housing Act 1969 (D47-8) restore the security of tenure which had been undermined by the 1957 Rent Act. It is now an offence for a landlord to evict a tenant from protected premises without a Court order. The 1957 Rent Act allowed protected rents to become decontrolled when the premises were relet. The Acts of 1965-68 stipulate that the vacation of a protected property will result not in decontrol but in conversion on reletting to a regulated tenancy under the new Acts unless it is a controlled tenancy of rateable value not over £10 in London or £50 elsewhere. Both regulated and controlled tenancies are protected.

Under the Acts of 1965-68 security of tenure is provided for regulated dwellings with rateable values (A) above the controlled figures (see above) and up to £400 a year in the Metropolitan Police District and £200 elsewhere to which the rules summarised in the next paragraph apply except increases permitted as a result of landlords improvements under the 1969 Act (as to which see D49). (B) Those tenancies still controlled are roughly the same as those to which the old Rent Restriction provisions of 1920-39 continue to apply.

Rent officers or assessment committees can revise rents in category (A) Tenancies under (a) are called regulated tenancies. Certain statutory tenancies of formerly requisitioned dwellings (which would have expired on 31 March 1966) are continued after that date as regulated tenancies. Occupiers who are not tenants (i.e. those in occupation necessarily because of their employment such as caretakers) are included under the term tenants. A tenancy of which a non profit making Housing Association is landlord is exempt from regulation.

The task of the rent officers and rent assessment committees is to fix fair rents on application of landlord or tenant or both in counties county boroughs London boroughs and the City of London. They are to take into account all the circumstances age character locality and state of repair of the dwelling but disregard due to the tenant's neglect and improvements by the tenant are to be disregarded as is also any great demand (exceeding supply) of dwellings in the district. The fixed rents are to be registered and must include payments for furniture and services (if any). If the landlord pays rates that fact is to be noted and the registered rent plus the rates may be recovered from the tenant. If the cost of services or of repairs to be done by the landlord is a variable sum the registered terms must say so. The landlord cannot lawfully recover more than the registered rent taking the above variations into account.

It is unlawful for any person (with intent to cause the residential occupier to give up occupation or to refrain from pursuing his rights or remedies) to do anything calculated to interfere with his peace or comfort or persistently to with draw or withhold services reasonably required for occupation. Residential occupier means a person occupying the premises as a residence either by contract or by any Act of Parliament. The penalty is a fine up to £500 or imprisonment up to six months or both, before the magistrates for a first offence and a fine up to £500 or the imprisonment or both for a subsequent conviction. The occupier even if the premises are not protected (i.e. not subject to the Rent Restrictions Acts or certain other statutes) cannot lawfully be evicted even when the tenancy has

terminated and the occupier continues to reside there without leave of the Court. In default the owner is liable on conviction before the magistrates to a fine up to £100 or six months imprisonment or both—unless he can prove that he reasonably believed that the occupier had ceased to reside in the premises. Occupiers protected are the tenant or former tenant a lawful subtenant and the widow or widower or any member of the family of either residing with the occupier at his death.

The demand for or taking of a premium as a condition of the grant, renewal, continuance or transfer of a protected tenancy (in addition to the rent) is forbidden (except in case of expenses paid by the outgoing tenant for a period after the transfer or improvements he has paid for or as a refund to the outgoing tenant of any reasonable premium which he himself paid on taking possession or (if part of the premises are business premises) for goodwill transferred to the incoming tenant). There are also restrictions on the demand for or taking of a premium in relation to a protected tenancy: broadly speaking a premium is lawful only if the tenancy or its continuance is for more than seven years—and then only if the registered rent is higher than the rent payable under the tenancy.

There are wide provisions regarding the protection of occupiers of furnished dwellings and regarding mortgages.

Under the Leasehold Reform Act 1967 a tenant occupier of a long leasehold house in which he resides can acquire on fair terms the freehold or a lease extended for fifty years. Long means a tenancy originally granted for more than twenty-one years. But the tenancy must be at a low rent—i.e. not exceeding two thirds of the rateable value. The fair terms are ascertained by an elaborate formula (sec 9). The tenant must have occupied the house as his main or only residence for not less than five years.

(For Housing Act 1969 see D47-8)

4 Mortgages.—The word *mortgage* is Norman French its literal meaning is dead pledge. The process of mortgaging land and buildings is roughly analogous to that of pawning a piece of jewellery as security for a loan of money—with the important difference that the land cannot of course be physically handed over to the lender (as can the jewellery) to be kept in his custody until the loan is repaid. But a pledge and a mortgage have this in common—that the parties intend no change of ownership: the borrower (the *mortgagor*) is and remains owner of the property after as well as before the transaction. In exchange for a loan of a certain sum the lender (the *mortgagee*) temporarily enjoys a *charge* upon property worth (it may be) much more than that sum as security for the repayment of the loan with the stipulated interest at the stipulated time. The borrower is still the property owner.

Because of the essential immovability of land the mortgage transaction is effected by a *mortgage deed* which sets out the terms on which the loan is granted. Generally speaking the borrower (the *mortgagor*) is permitted to remain in possession of the mortgaged property unless and until he fails to pay an instalment of interest or to repay the capital when called upon or unless and until he breaks some condition of the mortgage deed. In early times such failure was often the signal for the lender (the *mortgagee*) to oust him permanently from possession and even to deprive him of ownership of the property. But the courts of equity as we have seen (D7(2)) gradually evolved the rule that it was unconscionable for the lender to enrich himself at a low cost to himself from a transaction in which the intention of the parties was to pledge the property temporarily as a security not to sell it permanently for a small sum. Hence was evolved the concept known as the *equity of redemption*—the rule that even after the *legal date* fixed by the deed for repayment of the loan and for freeing the property from the mortgage the borrower should still remain entitled to *redeem* the property (i.e. to free it from the charge) by tendering to the lender the balance of the loan with all interest and costs to date and that the lender should thereupon be bound to give the borrower full and unfettered rights over the property, free from all the conditions of the

mortgage and in the same state as it was in originally. The lender must get no collateral (or additional) advantage of a permanent kind once the loan interest and costs were paid off and this is still the law today.

The law as stated above has established the principle that the borrower who mortgages his freehold or leasehold interest as security for a loan of money shall not be deprived of his ownership but shall retain such ownership after the execution of the mortgage deed. That deed is in the first place a contract or agreement under which the borrower promises to repay the loan to the lender with interest at a certain rate in one sum or by instalments and meanwhile for the lender's protection to keep the property insured in proper repair and so forth. But that is not all: it is clearly important that the lender should in addition be granted an interest *in the property itself*—an interest which will enable him to take actual possession of the property if need be to enforce his rights much as the pawn broker has the right to possession (though not ownership) of the pledged article until the loan is repaid.

The Law of Property Act 1925 devised a method of giving the lender a legal estate in the property while still preserving the rights of ownership of the borrower. That Act provides that the grant of a mortgage of land in whatever form it is effected shall confer upon the lender a term of years *absolute*—i.e. a legal estate in the land itself which the lender can deal with by sale and which will be transmitted as an interest in land to his legal personal representatives upon his death. It is further provided that on the final discharge of the mortgage (i.e. the repayment of the loan with all interest and expenses due to the mortgagee) that term of years shall cease and be extinguished the borrower thereafter continuing to hold his freehold or leasehold estate free from the mortgage term of years and free also from all the conditions of the mortgage deed.

In such a scheme it was necessary to distinguish the term of years conferred by the mortgage from any term of years absolute which might be or might have been conferred upon a lessee or under lessee by way of a lease or tenancy (see D24(1) Leaseholds). For the purpose of such distinction the Act provides that if the mortgagor is (the borrower's) legal estate is a *freehold* the mortgage deed confers upon the mortgagee (the lender) a term of 3000 years thus leaving to the mortgagor a legal reversion to commence after the expiration of that term (since the freehold estate is not limited to expire at any particular time). And if the mortgagor's legal estate is a *leasehold* due to expire at the end of a fixed period the mortgage deed confers upon the mortgagee a term of years to expire ten days before the leasehold term thus again leaving the mortgagor with a legal reversion (in this case of ten days only).

In this way each party has a legal estate in the land itself quite apart from the contractual rights and obligations in regard to the loan which can be enforced by and against him personally. The mortgagor can sell his freehold subject to the mortgage term and the obligations of the mortgage deed. The mortgagee can sell his mortgage term with the benefit of the rights that go with it. The sale of a freehold (whether subject to a mortgage or not) is effected by a deed called a *conveyance*; the sale of a leasehold is effected by a deed called an *assignment*. The mortgage term can be dealt with in a deed called a *transfer of mortgage*. In every case the mortgagee takes over the vendor's legal estate in the land subject to or with the benefit of the personal obligations or rights in the original deed. In case of the death of the mortgagee or mortgagor the legal estate in question and the rights or obligations are transmitted to his personal representatives.

Finally it should be mentioned that as an additional safeguard the *title deeds* (evidencing the mortgagor's freehold or leasehold title) must be handed over to the mortgagee when the mortgage deed is executed as part of the latter's security. The mortgagor must take care to get them back when he redeems the property by paying off the loan interest and expenses.

5 Title.—(a) *Evidence of title.*—Before freehold or leasehold property changes hands it is the duty

of the purchaser's solicitor to *investigate title*—i.e. to satisfy himself that the vendor has a proper title himself and a proper right to convey or assign. Generally speaking the purchaser's solicitor must go through the deeds (evidencing sales transactions on death grants of leases grants and redemptions of mortgages) for at least fifteen years back. He must check every step in the *devolution of title* (i.e. every change in ownership) and make *requestions* (i.e. demand explanations) on any point which is doubtful. This is still the system over the greater part of the country. No stamp duty is payable on conveyances up to £5 500 from £5 500 to £7 000 is 10s. per cent. after that it rises to £1 per cent.

(b) Registration of Title.—With a view however to simplifying such procedure the Land Registration Acts have provided for a different system. In areas to which an Order in Council has made the system applicable registration of title is *compulsory* upon any sale of freeholds or of leaseholds having more than forty years to run. Under the Land Registration Act 1926 this system is gradually being extended over the whole country. Registration is effected in the following way: one of a number of District Registries investigates the title of every freehold or leasehold sold after the appropriate date *once and for all*. If they are satisfied that it is in order they register the owner as *registered proprietor* of the land with *absolute title* to his freehold, *absolute or good leasehold title* to his leasehold. (These kinds of titles indicate that the title is unexceptionable, but if there is a slight doubt the proprietor may be granted a *qualified title*, and if he is in possession of the land he may be granted a *possessory title* which signifies little more than the fact of possession.) The Chief Land Registrar is empowered however to convert possessory titles into absolute or good leasehold titles after fifteen years in the case of freeholds and after ten years in the case of leaseholds. He may convert qualified titles at any time according to circumstances.)

The Land Registry issues to the registered proprietor a *land certificate* certifying (on behalf of the Government) that a registered title of the appropriate kind has been granted in any further transactions relating to that particular land the purchaser's solicitor need not concern himself with the original deeds save in exceptional cases. He can generally rely upon the certified statements made in the land certificate on which the name of the new registered proprietor is entered by the Land Registry officials when a transfer in his favour or the grant of a lease to him is lodged at the Registry. There are appropriate sections in the land certificate for registration of a mortgage and the particulars of the mortgagee for the time being.

6 Joint Ownership—If two or more persons are the owners of freehold or leasehold property that does not mean that A owns one part of the land and buildings and B and C other parts: the effect is that all of them *jointly own the whole*. (The analogy will be clear if the reader considers the case of a motor car owned jointly by A, B and C: clearly all three own the entire car between them; it cannot be said that A owns the engine, B the chassis and C the body.) The Law of Property Act 1925 recognises such joint ownership of land by means of a device known as a *trust for sale*. The respective rights of A, B and C (equal or unequal) can be fully enforced only if and when the property is *sold* and the net proceeds of sale in money divided up in the proper proportions and any or all of the joint owners can insist upon such sale or division for the purpose of obtaining their proper shares. But while the property remains unsold all the joint owners have rights according to the proportions of their shares: if for example the property is let the net rents after paying for repairs and other expenses must be divided between them in those proportions. Up to four persons can jointly own a freehold or leasehold legal estate in land: if more than four are entitled to the *beneficial interest* then four of their number only must hold the *legal estate*, and equity will enforce the *beneficial rights* of all against the legal owners. A purchaser from joint owners of the legal estate is concerned only with

the latter's *legal title*, provided he hands over the purchase money to them (not being less than two) or somebody authorised by them: the purchaser is not responsible for what they may do with that money. If those legal owners from whom the purchaser buys fail to pay over the proper shares to those beneficially interested it is for the latter to enforce their rights against the vendors who have sold the legal estate by action in the Chancery Division, the guardian of equity. The purchaser's title to the land itself is not affected by the vendors' failure properly to carry out the terms of the trust for sale so long as the legal estate has been properly transferred to him and he has paid the purchase money to not less than two legal owners.

III Property Other than Land (Moveables)

1 Chattels—Chattels are *concrete things* which can be the subject of ownership other than land or buildings and other than objects so closely affixed to land or buildings that they are regarded as part thereof (e.g. growing crops and trees or landlord's fixtures built into some structure or so closely attached that they cannot be removed without serious damage to the structure).

In the ordinary way chattels can be sold or given away without any special legal formalities—merely by *physical transfer*—i.e. by the owner handing them over to somebody else. If a chattel is to be *mortgaged* as security for a loan the procedure differs according to whether the person pledging it (the borrower) is or is not to retain *possession* of the chattel. (His *ownership* in either case is not disturbed.)

(a) If as happens when an article is *pawned* the borrower is not to keep the article in his possession: he hands it over to the pawnbroker who hands him in exchange the agreed loan and a pawn ticket. On production of the pawn ticket and the repayment of the loan with the stipulated interest the borrower is entitled to receive the article back. (Provision is made by law for cases where the borrower defaults in payment or where an unreasonable time elapses before he seeks to redeem what he has pledged.)

(b) If however the arrangement is that the borrower is to retain possession of the mortgaged article (as may happen if he borrows from a moneylender on the security of his furniture) then the borrower must execute and hand to the lender a document called a *bill of sale*. The law relating to such a document is extremely complex, but the most important provision is that the lender cannot enforce his rights unless he *registers* the bill of sale at the Bankruptcy Court in a register which any member of the public can inspect for a small charge. If then some member of the public desires to purchase the article from the person in whose possession it remains but has reason to suspect that that person though he may be the owner has mortgaged it to a money lender it is open to the proposing purchaser to inspect the register of bills of sale to satisfy himself on the point. If he finds an entry against the owner's name he will be wise not to proceed with the transaction. If he finds no such entry and has no reason to believe the owner to be bankrupt he can usually assume that there is nothing to prevent the person in possession from passing a good title to him. The proposed purchaser can also inspect the register of bankruptcies in order to see whether the vendor has the right to sell (see D12(2)).

2 Things in Action—These (see D19(1)) are *intangible rights* which can be owned and dealt with but because of their abstract nature cannot be physically transferred. If Brown owes Jones £50 Jones (the creditor) can transfer to Robinson the right to collect the £50 from Brown. Jones does this by a document called an *assignment* of the debt and (most important) by giving *written notice* to Brown (the debtor) that Robinson is now the creditor instead of Jones.

Similarly if Jones owns ten shares in Brown & Co. Ltd. Jones will hold a *share certificate*—i.e. a document certifying the amount of his share holding. He has certain rights in the company but these depend upon the company's *memo*

random and articles (D12(2)) and upon the *registration* of his name in the company's register of share holders. The share certificate is only *evidence* of his rights—it is not in itself a piece of property and the physical handing over of the certificate will effect nothing unless Jones executes a *share transfer* in Robinson's favour and Robinson sends it to the company for registration together with the old share certificate in Jones's name. After registration of Robinson's name the company will destroy the old certificate and issue a fresh one to him.

Again if Jones has insured his life with the Brown Life Assurance Society he will have received a *policy* which is *evidence* of the right of his legal personal representatives to be paid £1000 on Jones's death. If Jones wishes during his life time to transfer that benefit to Robinson he can do so but it will not suffice for him merely to hand Robinson the policy. To transfer the *rights* under the policy he must execute an *assignment* in which

it is stated that Jones being the policy holder and entitled to certain rights thereunder now assigns those rights to Robinson. But no transfer of those rights will have been effected until Robinson has *notified* the Assurance Society of what has been done and sent it the policy and the assignment for *registration* in its books.

These examples illustrate the principle set out in the Law of Property Act 1925 that an *assignment* in writing by a person (the assignor) entitled to any debt or other thing in action in favour of another person (the assignee) if *notice* in writing is given to the debtor or other person on whom the obligation rests (in the above examples to Brown the Company and the Assurance Society) shall entitle the assignee to all the assignor's rights including the right to enforce those rights by action in the Courts without calling upon the co-operation of the assignor in whom the right to the debt or other thing in action was originally vested.

III FURTHER DETAIL ON SOME BRANCHES OF THE LAW

DIVORCE AND OTHER MATRIMONIAL CAUSES

1 HISTORICAL SKETCH

The anomalies in this branch of the Law of England and the legalistic attitude of the Courts to the subject are principally due to historical reasons. For centuries the Church of Rome was the supreme ecclesiastical authority and the law of that Church (Canon Law) applied to *matrimonial causes*—that is to say disputes relating to any marriage and the mutual rights and duties of the spouses. Marriage was indissoluble—that is there was no such thing as divorce in the modern sense of breaking the legal tie. But the Ecclesiastical Courts which alone administered the matrimonial law before 1858 might for certain reasons grant a *decree of nullity* (a declaration that a particular marriage was null and void). In other cases they might grant what is now called a *legal separation* (known in those days as a divorce *a mensa et thoro*—a banishment from bed and board) this latter decree however did not dissolve the marriage bond, but merely gave judicial sanction to the spouses living apart from each other and regulated the terms of the separation. After the Reformation the Ecclesiastical Courts continued to deal with matrimonial causes on the same legal principles as before.

As a result of the Acts of Supremacy passed in the reigns of Henry VIII and Elizabeth I the Sovereign was declared to be the supreme governor of the Realm in all spiritual and ecclesiastical as well as temporal causes. This royal supremacy exercised constitutionally through Parliament was part of the law of the land since there was no limitation upon the power of Parliament (see D8), special Acts were passed from time to time to effect that which neither the Ecclesiastical nor the Civil Courts then had jurisdiction to do *viz* to break the marriage tie itself. A divorce of this kind known as a divorce *a vinculo matrimonii* (a divorce from the marriage bond) was rare for the procedure was cumbersome and expensive. Except by the passing of a special Act of Parliament there was no means of getting a marriage dissolved before the year 1858.

The Matrimonial Causes Act 1857 transferred the jurisdiction in matrimonial matters from the Ecclesiastical Courts to the new Civil Court for Divorce and Matrimonial Causes but perpetuated the old ecclesiastical practice with regard to nullity suits and judicial separation (formerly known as divorce *a mensa et thoro*). Apart from this rearrangement the Act took the revolutionary step of conferring upon this Court a new judicial power of granting a divorce in the modern sense of a complete dissolution of marriage. As we have seen (D8) the Supreme Court of Judicature Act 1873 and subsequent legislation set up one single High Court of Justice of which the Probate Divorce and Admiralty Division formed part taking over (with other work) the jurisdiction which had been conferred in 1857 upon the Court for Divorce and Matrimonial Causes.

This jurisdiction formerly in the hands of the Probate Divorce and Admiralty Division is now allocated to the new Family Division which will deal with cases affecting the family generally. Great changes have been effected by statute (notably in 1923 1925 1937 1950 1963 1965 1967 1969 and 1970) extending the grounds for divorce and the jurisdiction of the Court but in the interpretation and adaptation of principles the great body of case law (see D7) which enshrined the principles and practice of the old Ecclesiastical Courts is not without its influence today. The principles of equity (see D7) however have not modified the strict legalism of this branch of the law equity has no application to the law of matrimonial causes (except for resort to injunction (see D15) and for the protection of the wife's person or property).

2 POWERS OF INFERIOR COURTS—SUMMARY JURISDICTION

Concurrently with the jurisdiction of the Divorce Division of the High Court Magistrates' Courts now have power (Matrimonial Proceedings (Magistrates' Courts) Act 1960 and Rules made thereunder) to grant relief (by a *matrimonial order*) to either spouse (the *complainant*) in certain cases of misconduct on the part of the other spouse (the *defendant*). The procedure is simpler quicker and cheaper than in the High Court. A Magistrate's Court may grant a matrimonial order if such order provides (a) that the complainant shall be no longer bound to cohabit with the defendant that has the same effect as a High Court decree of judicial separation (see D32). A Magistrate's Court may also provide (b) that the husband shall pay the wife or (c) where the husband's earning capacity is impaired by age illness mental or physical disablement that the wife shall pay the husband) such weekly maintenance as the Court thinks reasonable *plus* (h) weekly payments for each dependent child (d) the child's custody (up to 16 years of age) may be granted to the complainant or (e) to a county council or county borough council or (in special circumstances) (f) such child may be ordered to be placed under the supervision of an independent person (such as a probation officer) and (g) access to the child may be granted to either spouse or to any parent. (There are special provisions relating to (d) (e) and (f). The former limits of £7 10s for wife or husband and of £2 10s for a child were repealed by the Maintenance Orders Act 1968.

Either spouse may apply for relief on the ground that the defendant—

- (1) has *deserted* the complainant
- (2) has been guilty of *persistent cruelty* to the complainant or an infant child of the complainant or of the family (see D30(2)).

(3) has been convicted (i) on indictment (i.e. by a jury) of any *assault* on the complainant or (ii) by a Magistrates' Court of certain offences (involving imprisonment for not less than one month) *against the person* of the complainant or (iii) of a *sexual offence* (or an attempt thereof) against an infant child of either spouse who is a child of the family

(4) has committed *adultery*

(5) while knowingly suffering from *venereal disease* has insisted upon sexual intercourse with the complainant or permitted such intercourse without the complainant being aware of such disease

(6) is a *habitual drunkard* and or a *drug addict*

(7) being the husband has compelled the wife or led her to *submit to prostitution*

(8) being the husband has wilfully *neglected to provide reasonable maintenance* for the wife or any dependant child of the family

(9) being the wife (in case (c) above) has *wilfully neglected to provide or make a reasonable contribution to reasonable maintenance* for the husband or any dependant child of the family having regard to any resources of the spouses

A Magistrates' Court has jurisdiction to hear any such complaint if either spouse ordinarily resides in the Court district or (except in (3) above) if the cause of complaint arose in that district or (in case (3)) if the offence or attempt arose in that district. Jurisdiction is also exercisable if the complainant resides in England and the parties last resided together in England (even if the defendant now resides in Scotland or Northern Ireland) or if the defendant resides in England though the complainant resides in Scotland or Northern Ireland. The Court may order the costs of the application to be paid by either party.

The general rule is that a complaint under (4) above must be made within six months of the date when the act of adultery first became known to the complainant. A complaint on any other grounds must generally be made within six months of the ground of the complaint arising unless the complainant was abroad at the time but this time limit does not apply to such continuing offences as desertion (see below) or wilful neglect to maintain.

These domestic proceedings as they are termed may be heard before one stipendiary (legally qualified magistrate) or not more than three justices of the peace including so far as practicable both a man and a woman. The hearing is in private the public being excluded and newspapers are prohibited from publishing details. Domestic proceedings must be dealt with separately from other matters and reports from probation officers may be received on the subject of any attempted reconciliation or on the means of the parties. The same applies (under an Act of 1968) to appeals to the High Court from a Magistrates' Court's hearing of a matrimonial case (see Appeals below). In general the magistrates should apply the same general principles as are applied in the Divorce Division. Lay justices of the peace are advised on the law by their legally qualified clerk.

A Magistrates' Court however has no power to grant a divorce or to annul a marriage; the jurisdiction to make such a decree is in the hands of the Family Division of the High Court of Justice and since 1967 of certain designated County Courts in undefended cases. Generally speaking the law relating to domestic proceedings in Magistrates' Courts now (November 1970) remains unchanged but in the High Court and designated County Courts there have been far reaching reforms.

A maintenance order may be enforced by committing the defendant to prison if his failure to comply with the order is shown to be due to wilful refusal or culpable neglect and if he has fallen into arrears. But this is the final resort if enforcement fails by attachment of earnings i.e. an order to employers to deduct the debt from the debtor's wages. Arrears becoming due more than a year before application for enforcement

in the High Court or designated County Courts (see (1) below) may be remitted or made payable by instalments.

No order is enforceable while a wife is residing with her husband and no order may be made on the application of a complainant where it is proved that he or she has been guilty of adultery unless the defendant condoned or connived at (see below) or by his wilful neglect or misconduct condoned to (i.e. tended to lead to) the adultery. An order already granted will be *discharged* i.e. its effect will be terminated on proof of the complainant's adultery or on proof that the spouses voluntarily resumed cohabitation except for any one period of not more than 3 months with a view to effecting a reconciliation.

If a matrimonial cause is pending in the Family Division of the High Court, no application for a separation or maintenance order ought to be dealt with by a Magistrates' Court. And a Magistrates' Court may refuse to make any order when the suit in question would in its opinion be more conveniently dealt with by the Family Division.

By the Matrimonial Proceedings and Property Act 1970 a maintenance order will be discharged by the remarriage of the party in whose favour it was made and the Court may order overpayments to be refunded.

Appeals. A Magistrates' Court has power to state a case upon a point of law (not a question of fact) arising on the application for decision by a Divisional Court consisting of two or more judges of the Family Division. And an appeal from a Divisional Court lies to the Court of Appeal by leave of either the former or the latter.

3 MATRIMONIAL CAUSES in the HIGH COURT and UNDEFENDED DIVORCE CASES in DESIGNATED COUNTY COURTS

(1) Constitution of the Courts

The President of the Family Division and not less than three other High Court Judges attached to that Division are the permanent judges for Matrimonial Causes. They sit both at the Royal Courts of Justice in London and at Assizes. (See reference to proposed new Family Division of High Court (D28(2)). Certainly subsidiary duties are performed by the seven Registrars of the Principal Registry of the Division at Somerset House and by District Registrars in the principal cities of England and Wales. The Matrimonial Causes Act 1967 permits designated County Courts to grant divorces in undefended cases.

(2) Practice and Procedure

In contrast to domestic proceedings in Magistrates' Courts the Judges of the Family Division or of designated County Courts sit normally in open court though they have power to sit *in camera* (in private) where the ends of justice so require. In *nullity proceedings* however it is provided by statute that evidence on the question of sexual incapacity must be heard *in camera* unless the Judge is satisfied that the ends of justice require such evidence to be heard in open court. Press publicity is limited by statute to certain matters and the publication of indecent matter may give rise to prosecution in any matrimonial proceedings.

In general practice and procedure in the Family Division and designated County Courts are governed by statute by rules of Court framed by a judicial committee under statutory authority and by the principles and practice of the old Ecclesiastical Courts—except in proceedings for dissolution of marriage which the old Courts could not entertain (see D28(1)).

(3) Relief and Grounds for Relief

(a)—**Nullity of Marriage.** The High Court has power to declare a marriage null and void in two main classes of case.

(i) '*Marriages Void from their Inception*'—i.e. where one of the parties had another husband or wife living at the time of the cere

mony where there was a mistake as to the nature of the ceremony or the identity of the other party where one party had been declared of *unsound mind* and was detained as a lunatic at the time of the ceremony where the parties were within the *prohibited degrees* of relationship (e.g. brother and sister or uncle and niece) or where the ceremony was not in due form or was a mock marriage

(ii) *Marriages which are Voidable*—i.e. which stand good unless and until one party or the other (the Petitioner) successfully petitions the Court for annulment—i.e. where either party was sexually impotent at the date of the ceremony where either party has willfully refused to consummate the marriage where the marriage was induced by threats or fear or duress (i.e. force) or where one spouse was intoxicated at the time of the ceremony

The Act of 1965 added certain other grounds (a) where either party was at the time of the ceremony in fact of unsound mind but had not been declared so or was then a mental defective or then subject to recurrent fits of insanity or epilepsy (b) where the other spouse was at the time of the marriage suffering from venereal disease in a communicable form and (c) where the wife was at the time of the marriage pregnant by some person other than the petitioning husband. But in those last cases (a) (b) and (c) the Court must not grant a decree unless it is satisfied that the petitioner was at the time of the marriage ignorant of the facts alleged that the proceedings were instituted within a year of the marriage and that there has been no sexual intercourse between the parties with the consent of the petitioner since he or she discovered that there were grounds for a decree of nullity.

Where a marriage is void (see above) the law regards it as never having taken place at all. Where it is voidable the decree annuls the marriage retrospectively from its inception but certain transactions between the parties while they actually remained married are validated and the Court has power to order maintenance for the woman and any child who would in the normal way have been the legitimate child of the parties remains legitimate notwithstanding the annulment.

Sterility—i.e. inability to produce children—is not in itself a ground for annulment of the marriage. If the impotence of one spouse appears to be curable without danger the Court may be fore pronouncing a decree require that opportunity for cure be first given. If he or she refuses to undergo examination or treatment the Court may infer after hearing the other party's evidence that impotence exists. The petitioning husband or wife may ask for a nullity decree on the ground of his or her own impotence provided he or she did not know of it at the time of the marriage. And there have been recent cases in which both parties have been granted decrees.

Apart from the one year rule (mentioned in the last paragraph but two) in certain cases delay (however long) in petitioning for nullity is no bar to the grant of a decree.

(b) *Divorce*—(i) *Its Nature and Purpose*—Divorce means the breaking of the legal tie of marriage by a decree of the Court. There has been much controversy on the subject.

We have to start by facing the unpalatable truth that some marriages do break down in fact. The symptoms of break down may be continual strife and sometimes violence between the spouses so long as they continue to live together or there may be an actual breaking up of the home because one or the other finds the situation intolerable and leaves. The function of the law should be to deal with this state of affairs as best it can paying due regard (a) to the interests of the children (if any) who are innocent parties to the dispute (b) to the interests of the spouses and of any third party involved (c) to the interests of public decency and the safeguarding of family life generally.

Divorce is the drastic remedy provided by the civil law in the case of a marriage which has already broken down in fact the availability of

divorce does not bring about the break down any more than the availability of surgical treatment can be said to bring about ill health. A marriage may break down—that is to say the kernel of the marriage the mutual respect and affection between the spouses has withered away only an empty shell—the legal tie—continues to subsist between them. How should this situation be dealt with by law?

It is common ground among both the upholders of the orthodox view and those who advocated reform first that every possible effort should be made by private individuals and public institutions to effect a reconciliation if at all possible. Such efforts are favoured by the law and excellent work is done to this end by religious organisations, medical men, probation officers and such institutions as the Marriage Guidance Council.

Secondly it is common ground that if such efforts are unsuccessful and the breach proves irreparable in fact the interest of the children of the family should be paramount and no pious should be spared to secure their proper care and maintenance. The Matrimonial Proceedings and Property Act 1970 defines a child of the family as (a) a child of both parties and (b) any other child not boarded out with them by a local authority or voluntary organisation who has been treated by both parties as a child of the family. There are elaborate provisions for the protection of all such children (D33(1)) the welfare of the children is the paramount consideration irrespective of the rights and wrongs as between the parents. Nobody will deny that once the marriage has broken down in fact the children will suffer to some extent but it does not follow that they would suffer less if the legal tie between the parents were preserved or if the home with its atmosphere of strife and perhaps of violence were kept together at all costs—even assuming such a thing were possible. A divorce may not be granted unless the Judge has made an order declaring whether he is satisfied that all possible arrangements have been made for the care and upbringing of the children that the only children of the family are those named in the order that the arrangements are satisfactory or the best that can be devised or that there are no children of the family. A decree absolute made without such order is void. But if circumstances make it desirable to grant the decree absolute without delay although arrangements for the children have not been finalised the Court may make an order to that effect accepting an undertaking from one or both parties to bring the question back before the Court at the earliest opportunity. In the last named case nobody is entitled to question the validity of the decree once the Judge's order is made.

The Divorce Reform Act 1969 has revolutionised the law. The old attitude that divorce is a penalty upon the guilty party has been abolished. From 1 January 1971 (when the new Act came into force) only one ground for filing a divorce petition by either party (the petitioner) will exist viz that the marriage has irretrievably broken down—i.e. that it is impossible for the couple to go on living together as man and wife. After long debate Parliament decided that to prove such breakdown it would be impracticable for the Courts to investigate the whole history of the marriage which would require lengthy evidence from both parties perhaps lasting for days. The Act therefore provides five points of evidence on one of which the petitioner must satisfy the Court, satisfy means that he or she must convince the Court on a balance of probabilities—not (as in criminal cases (D9(2))) beyond all reasonable doubt. One of the five following points of evidence must be proved:

(a) that the respondent (the other party to the proceedings) has committed adultery and the petitioner finds it intolerable to live with him or her.

(b) that the respondent has behaved in such a way that the petitioner cannot reasonably be expected to live with him or her.

(c) that the respondent has deserted the petitioner for a continuous period of at least two years immediately preceding the petition.

(d) that the parties have lived apart for a continuous period of at least two years immediately preceding the petition and the respondent consents to the grant of a divorce

(e) that the parties have lived apart for a continuous period of at least five years immediately preceding the petition

(f) finally to cover those cases where one of the spouses has disappeared and not been heard of for many years

Any married person who alleges that reasonable grounds exist for supposing the other party to be dead may petition the Court to have it presumed that the other party is dead and to have the marriage dissolved

No petition for divorce on any ground may be presented until the expiration of three years from the date of the marriage unless a Judge is satisfied that there is a case of exceptional hardship upon the Petitioner or exceptional depravity on the part of the Respondent. Whether there is such a case is a question for the Judge's discretion upon the evidence brought before him. Concealment or misrepresentation by the petitioner may result in dismissal of the petition or postponement of the decree absolute until three years have elapsed since the marriage. The Judge must also have regard to the interests of any child of the family (D30(B)).

As to the above mentioned grounds for divorce

(a) *Adultery* means *voluntary sexual intercourse* between a husband and a woman who is not his wife or between a wife and a man who is not her husband. (A woman who has been raped is forced to have intercourse with another man against her will—is not guilty of adultery.) For obvious reasons direct evidence of the act of adultery is rare and the Court may infer from circumstantial evidence that adultery has taken place. But adultery alone is not sufficient unless the Court is satisfied that the petitioner finds it intolerable to live with the Respondent. The test for this will probably be the state of the petitioner's own feelings

(b) *Cruelty* (i) the Court must now be satisfied that the respondent has (i) behaved in such a way that (ii) the petitioner cannot reasonably be expected to live with him or her. Until there have been cases decided on this ground it is impossible to say how the Courts will consider (i) and (ii). Misbehaviour is a much more vague idea than cruelty which had been explained in many reported cases to mean conduct causing danger to life limb or health (bodily or mental) or giving rise to a reasonable apprehension of such dangers. But the new (i) and (ii) seem to depend not on the petitioner's feelings but on the Judge's opinion whether his or her unwillingness to go on living with the respondent is reasonable in the particular case before him or not. When cruelty was the basis the question was not: Would other people describe the respondent's conduct as cruel? but: Has this particular husband been cruel to this particular wife or vice versa? This question was for the decision of the Judge. Also in other legal connections *reasonableness* is a matter for the Court to decide and in (ii) (above) the words *be expected to live* seem to indicate that the new paragraph will be similarly interpreted

(c) *Desertion* means primarily the intentional permanent abandonment by one spouse of the other without that other's consent and without reasonable cause. Therefore there is no desertion in such cases (for example) as (i) where a husband cannot live with his wife because he is serving a sentence of imprisonment, (ii) where a husband leaves his wife for a short time for necessary business or family reasons intending to return to her (iii) while a separation continues with the consent of both parties (iv) where the spouse who abandoned the other had just cause to do so

Indeed in certain cases under (c) the doctrine known as *constructive desertion* may apply against the other spouse if he or she has (figuratively speaking) driven the first spouse away. *Constructive desertion* means not deser-

tion in the literal sense of walking out of the matrimonial home but conduct on the part of one party which is intended to force and virtually forces the other party to leave him or her. Thus if a husband brings his mistress to live with him in the matrimonial home and as a result his wife leaves him not only is the wife innocent of desertion in the legal sense but the husband is himself guilty of constructive desertion. It will be presumed against him that he intended to terminate his marital association and he has in fact carried out that intention. Such a case illustrates the principle that there are two elements in the legal meaning of desertion—the act of physical separation and the intention to bring normal married life to an end

In order to bring about desertion it is not necessary that the spouses should cease to live under the same roof: desertion is not with withdrawal from a place but from a state of things. It is sufficient that the Respondent has withdrawn from or forced the other to withdraw from life together in the same household

It should also be noted that desertion is not a single act but a continuous state of affairs. The Petitioner must prove that desertion without cause continued during the entire period of two years required by law as the basis of a divorce petition. Although (see above) desertion in the legal sense must be without the consent of the petitioning spouse recent judicial decisions have tended to dispense with the requirement that the deserted party must prove a continuing desire for the deserting party to return and a continuing willingness to receive and reinstatement the deserting party during the entire period of two years preceding the commencement of proceedings. In other words once the latter party's original act and intention of deserting has been proved that intention is presumed to have continued unless there is evidence to the contrary. A matrimonial order made by a Magistrate's Court (see (D28(2))) does not necessarily prevent the period of desertion from running unless the order contains a clause deliberately inserted to the effect that the parties shall no longer be bound to cohabit. (And the insertion of such a clause is rare.) Nor does a decree of judicial separation made by the High Court (D32(2)) but in both cases the period of living apart (two years) must precede such order or decree

If the deserting party makes an offer to return to the matrimonial home it is the duty of the other party to receive him (or her) back and to resume normal married life together if the offer to return is genuine and if no other matrimonial offence has been committed by the deserting party. Whether such an offer is genuine is a question of fact to be decided on all the evidence. It will generally be a wise safeguard for a deserted party who receives such an offer to take legal advice before accepting or rejecting it for if rejection of the offer subsequently proves to have been unjustified he (or she) may become the deserting party. This situation again arises from the legal view that desertion consists of two elements—the act and the intention of deserting

An honest and reasonable belief by one spouse that the other spouse has committed or is committing adultery if such a belief is induced by the other spouse's conduct may be just cause for the first spouse to refuse to live together and prevent him (or her) from being regarded as the deserting party

(d) This paragraph provides for new evidence of breakdown—viz that the parties have lived apart for at least two years continuously immediately before the petition and that the respondent consents to a divorce. Up to 31 December 1970 the old law continued to apply—that an agreed separation afforded no ground for divorce. Parliament and the Courts for many years set their faces against divorce by consent. But from 1 January 1971 living apart for two years even by mutual agreement though not amounting to desertion (D30(2)-(c)) will be regarded as evidence that the marriage has irretrievably broken down (D30(2)) and enable the Courts to grant a divorce. It no longer matters whether the parties ceased to live together through the fault of one or both or whether the separation is due to incompatibility so long as both consent to divorce

(e) This paragraph provides for further new evidence of breakdown—viz that the parties have lived apart for at least five years continuously immediately before the petition. It does not matter (except as stated below) whether the respondent consents or not or which party if any is at fault. This is the most controversial of the new grounds. It is likely that many husbands or wives who have deserted their spouses and have hitherto failed to persuade the deserted party to divorce the other spouse will take advantage of this new ground. To understand this change in the law it must be remembered that the new sole ground for divorce is *irretrievable breakdown* of the marriage. If the parties have not lived together for five years it will be obvious that the marriage has broken down beyond repair.

However, the Act provides certain safeguards against injustice and favours reconciliation when ever possible.

(1) It is the Court's duty in all cases to inquire so far as it reasonably can into the facts alleged by each side *unless* on those facts the Court is satisfied that there is *no irretrievable breakdown* it shall grant a divorce.

(2) In case (e) above the respondent may oppose a grant on the ground that divorce would result in grave financial or other hardship to him or her and that it would in all the circumstances be wrong to dissolve the marriage. If there is such opposition and (e) is the only ground for divorce which the Court would otherwise grant it shall consider all the circumstances including the parties conduct their interests and those of the children concerned (e.g. a new irregular union or the birth of illegitimate children) if the Court feels that a divorce would result in such hardship (as mentioned above) and that in all the circumstances it would be wrong to dissolve the marriage it shall dismiss the petition. Thus in case (e) the Judge will have a discretion to grant or refuse a divorce. Hardship includes the loss of any benefit which the respondent might acquire if the marriage continued (e.g. widow's pension rights on the petitioner's death *may* be such a benefit if it is a loss special to the particular case).

(3) In case (d) (divorce by consent after two years separation) the Court may after decree *nisi* and before decree absolute (D32(2)) on the Respondent's application rescind (*ie* cancel) the decree if it is satisfied that the Petitioner misled the Respondent (whether intentionally or not) on any matter connected with his or her consent.

(4) In cases (d) or (e) the Respondent may request the Court to consider his or her financial position. The Court must then pay regard to all the circumstances (age health conduct earning power financial resources and obligations of both parties and of the Respondent as they are likely to be after a divorce if the Petitioner dies first). The Court shall not grant a decree absolute unless satisfied that the Petitioner need not make financial provision for the Respondent or that any financial provision made is fair and reasonable or the best that can be made in the circumstances (perhaps e.g. that the Petitioner has a new family to maintain). Nevertheless the Court may if it thinks fit proceed with the case if it appears that circumstances render it desirable to grant the decree absolute without delay and if the Petitioner has given a satisfactory undertaking to make up proved financial provisions for the Respondent.

(5) In all cases any agreement or arrangement between the parties may be referred to the Court for its approval. The Judge again has a discretion.

(6) The Petitioner's solicitor must certify whether he has discussed with the Petitioner (in all cases) the possibility of reconciliation and given him or her names and addresses of persons qualified to help to bring the parties together. If at any time the Court feels there is such a possibility it may adjourn the proceedings for that purpose.

(7) Even if after the Petitioner's knowledge of the Respondent's adultery or experience of mis-

behaviour or desertion the parties live together for total period(s) of six months or less (in Magistrates Courts three months or less) with a view to reconciliation such period(s) shall be disregarded the same applies if the ground is living apart for 2 years or 5 years ((d) or (e) above) nor is the period of desertion broken ((e) above) by the six months trial period(s).

(8) But if the parties continue to resume life together after such knowledge of adultery for more than six months (in Magistrates Courts three months) that adultery cannot be relied on under (a).

Damages for Adultery—The petitioner's right to claim such damages under the old law was abolished from 1 January 1971 by the Law Reform (Miscellaneous Provisions) Act 1970.

Restitution of Conjugal Rights—This form of action has been abolished on the Law Commission's recommendation from 1 January 1971 by section 20 of the Matrimonial Proceedings and Property Act 1970.

Judicial Separation—A petition for this form of relief may be presented by either spouse on any of the grounds for which a divorce petition (*see above*) might have been presented but on such a petition the Court is not required to consider whether the marriage has irretrievably broken down. The effect of the decree (as in the case of a similar order made by a Magistrates Court) is that the Petitioner is no longer bound to live with the Respondent and cannot therefore be regarded as a deserting party. (The legal bond of marriage remains in force the procedure is therefore often employed by a spouse who does not desire divorce perhaps for reasons of conscience perhaps merely so as not to allow the other party freedom to marry somebody else.) It is however open to a Petitioner who has obtained a decree of judicial separation to petition for divorce on the same facts at a later date—provided that three years have elapsed since the date of the marriage (*see* D31(1)).

Decree Nisi and Decree Absolute—When the case comes on for trial the Judge will hear the evidence of the Petitioner and his or her witnesses and legal argument on his or her behalf. If the case is defended by the Respondent spouse or by the Co respondent (*ie* any man accused in the petition of adultery with a Respondent wife) or by any woman named in the petition as having committed adultery with a Respondent husband the Judge will hear their evidence and legal argument on their behalf. The Judge if not satisfied on one of the points (a) to (f) (D30-1) in a case of divorce or judicial separation must dismiss the petition in which event the married status of the parties will remain unchanged. If the Judge is satisfied on one of the points mentioned he will in a suit for judicial separation pronounce a final decree in a suit for divorce he will pronounce a decree unless he is satisfied *on all the evidence* that the marriage has not broken down irretrievably.

In a suit for nullity or divorce the Judge will pronounce a decree *nisi*—*ie* an order that the marriage is to be annulled or dissolved unless (*ass*) before that event takes place some cause is shown to the Court why final annulment or dissolution ought not to be permitted. Intervention for this purpose may be made by an official known as the *Queen's Proctor* or by any member of the public. Such interventions after decree *nisi* are rare but may be made in divorce cases on the ground for example that some material fact was concealed from the Court at the hearing. (And *see* D30(2)—orders regarding children of the family.)

If such intervention succeeds the decree *nisi* will be rescinded (*ie* cancelled) and the parties will retain their former status. If there is no such intervention or if such intervention is dismissed then the marriage will be finally annulled or dissolved on application (on a special form) at the Divorce Registry concerned by or on behalf of the Petitioner not earlier than *three months* after the decree *nisi* (unless the Court fixes a shorter time by

special order). If the Petitioner does not make such an application then the Respondent may do so after the lapse of a *further three months* (*i.e.* six months after the date of the decree *nisi*) and the Court has power to grant or refuse such application or to deal with the case as it thinks fit.

The decree which finally annuls or dissolves the marriage is called a *decree absolute*. Unless and until it is granted the marriage tie still subsists: the decree *nisi* does *not* terminate the status of husband and wife. But the *decree absolute* does terminate that status leaving both parties free to marry again.

Custody of Children—Apart from the general power of the Family Division as guardian of equity (D7) to protect the person and the property of any minor (D12) and of the Local Authority under the Children and Young Persons Act 1969 (even though there may be no matrimonial proceedings between its parents) and apart from the additional powers of that Division and of Magistrates Courts under the Guardianship of Infant Act 1925 to appoint a guardian or guardians for any infant and to make orders for either parent to have access to the infant (*i.e.* to see it periodically) and for the infant's maintenance the Family Division itself may make orders for the custody, maintenance and education of the children of the family in any matrimonial proceedings and give directions for placing them under the protection of the Court and for access to them by either or both of the parties. The expression 'children of the family' includes children lawfully adopted by both husband and wife, children of a bigamous marriage which has given rise to nullity proceedings (D29) and also children born before the marriage of their parents and legitimated by that (subsequent) marriage. The new definition of the term which is very wide is stated on D30(2). The Court may make such orders and give such directions at any time after proceedings have been commenced for nullity, divorce or judicial separation: it may make interim orders and give interim directions from time to time during the proceedings. It is however unusual for the Divorce Division to make orders for custody of or access to any child over the age of sixteen (since such orders would be difficult to enforce).

In all such proceedings in whatever court they may be taken the paramount consideration is the welfare of the children—not the punishment of either parent nor any privilege of the father as against the mother or *vice versa*. (It is for example unusual for the Court to deprive the mother of the custody of a very young child even though she has committed or is living in adultery—unless of course she is neglecting the child or is a 'bad mother' in the widest sense.) In some cases for good reason both parents may be passed over and the custody of the child may be given to some third party or to a local authority.

Financial Provision—The Matrimonial Proceedings and Property Act 1970 makes very detailed new provision for the maintenance of a divorced spouse and/or for children of the family (D30(2)).

Apart from the *occupation rights* in or the transfer of the matrimonial home (D34(2)) the Act provides that a spouse who does substantial (*i.e.* important and lasting) work or contributes substantially in money or money's worth to the other spouse's property (not merely the matrimonial home) shall acquire such a share of the beneficial interest in that property as may seem just to a Court dealing with the matter. Jurisdiction in such property disputes is given to the High Court as well as a County Court even if the marriage has been dissolved or annulled within the past 3 years.

If spouses are *judicially separated* (not divorced) when one of them dies *intestate* (D19(2)) that one's estate shall devolve (*i.e.* be dealt with) as if the surviving spouse were already dead (but not in case of a Magistrates Court separation order—D29(1)).

The old expressions *alimony* and *main tenance pending suit* are abolished. All financial assistance to a spouse or children during or after the termination of matrimonial proceedings is

known as *ancillary relief* (*i.e.* subsidiary) and it may consist of periodical payments (so much per week or per month) or lump sum(s) (one or more payments of a substantial amount). The Court has power to order such periodical payments during the proceedings for the respondent spouse and children of the family as it thinks reasonable. On granting a decree the Court may order the petitioner to make to the respondent (a) such periodical payments as the order may specify and/or (b) to secure such payments to the Court's satisfaction (by deposit of a capital sum to produce enough interest to satisfy the periodical payments) and/or (c) to pay to the other spouse such lump sum or sums in one amount or by instalments as the Court may specify to enable the other spouse to meet liabilities reasonably incurred (perhaps including legal expenses) in maintaining him or herself or any child of the family. Such order may (at the Court's discretion) be made (a) before or on granting the decree or at any time after wards (b) even if the proceedings are dismissed forthwith or within a reasonable period. If any child of the family is over 18 payments may be ordered direct to him or her. The Court has now the new power to order (a) one spouse to transfer to the other or for the benefit of a child of the family some specified property or (b) to settle (D23(2)) such property for the benefit of the other spouse or any such child or (c) to vary any voluntary settlement made between the spouses before or after marriage whether by will or other wise or (d) to extinguish or reduce the interest of either spouse under such settlement.

In deciding the nature of such ancillary relief (see above) the Court must consider all the circumstances of the case including (a) income earning capacity, property and other financial resources of each spouse; (b) financial needs, obligations and responsibilities which each spouse has or is likely to have in future (*e.g.* responsibility for a new wife and children); (c) the family's living standard before the marriage broke down; (d) ages of the spouses and duration of the marriage; (e) either spouse's physical or mental disability (if any); (f) each spouse's contribution to the family's welfare; (g) the value of any prospective benefit which a spouse may lose by divorce or annulment (D32(2)). The Court shall so exercise its powers as to place the parties so far as practicable and just (having regard to their conduct) in the financial position they would have been in if there had been no breakdown. In addition in regard to any child of the family, the Court shall have regard to the way in which that child was being or was expected before the breakdown to be educated or trained, whether and to what extent each spouse assumed responsibility for the child's maintenance, whether he or she knew the child was not his or hers, and the ability of any other person to maintain the child. Similar provisions apply if without divorce nullity or separation a responsible spouse is found by the Court to have wilfully neglected to provide reasonable maintenance to the other spouse or any child of the family for whom it was reasonable to expect the spouse responsible to provide.

If the Court considers that *any* child of the family needs immediate financial assistance but it is not yet possible to decide how much and for how long the Court may order the spouse responsible temporarily to make such reasonable payments as the Court thinks fit. The maximum period of such ancillary provision (a) for a spouse is the joint lives of the spouses or (b) the other spouse's remarriage (if earlier). For a child of the family the maximum term is usually 18 (if earlier) the child's birthday next following the upper limit of compulsory school age (soon to be 16) but the relief may be extended beyond 18 if the child is receiving education or being trained for a trade, profession or vocation (*e.g.* an articled clerk or apprentice) until the death of the person liable except for arrears. The Court may vary or discharge any of such orders. Legal personal representatives (D22(1)) of a deceased spouse are not liable for distributing his or her estate after the expiry of 6 months from probate or letters of administration (D25(1)) without regard to the possibility of arrears, but the child may make a claim against the beneficiaries of the

estate for any sum which became due not more than one year earlier

The Act also contains elaborate provisions for the variation extension or discharge of voluntary maintenance agreements made between the parties such changes may sometimes be made by Magistrates as well as by the High Court. There are also safeguards to prevent any party responsible from evading his or her responsibilities by entering into transactions of certain kinds which the Court may set aside (*see* *cancel*).

It will be seen from this necessarily concise summary of the details of the Act that very considerable powers and duties are conferred upon the Courts to enable them to order proper provision to be made for the victims whether spouses or children of any breakdown of marriage. Although such breakdown may now be followed by divorce (whoever is at fault) that does not mean that the welfare of dependents whether adults or children can be neglected by the person to whom divorce annulment or separation is granted.

Domicile—It has been explained above (D11) why the English Court will not generally speaking grant a divorce to a man who is domiciled abroad. Since the domicile of a wife is the same as that of her husband (even if she has not lived with him for many years) the refusal of the English court to accept jurisdiction has caused hardship in many cases. To mitigate this hardship the Matrimonial Causes Act 1965 (not repealed) conferred upon the Divorce Division an additional statutory jurisdiction in the following cases in favour of a wife even if her husband is not domiciled in England.

(a) In any matrimonial proceedings other than for a decree of presumption of death and dissolution of marriage (*see below*) if (i) the wife has been deserted by her husband or the husband has been deported from the United Kingdom as an alien and (ii) immediately before the desertion or deportation the husband was domiciled in England.

(b) In proceedings for divorce or nullity if (i) the wife is resident (*see* *actually living for the time being*) in England, and (ii) has been ordinarily resident there for a period of three years immediately preceding the commencement of the proceedings, and (iii) the husband is not domiciled in any other part of the United Kingdom or in the Channel Islands or the Isle of Man. (The two last named territories have their own separate systems of law.)

(c) In proceedings for a decree of 'presumption of death and dissolution of marriage' the husband is presumed by law (for the purpose of ascertaining the wife's domicile) to have died immediately after the last occasion when she knew or had reason to believe him to be living. (Thus the wife can acquire an English domicile of her own as from that date.)

(d) Recent cases have decided that the English courts shall have the right to recognise a divorce granted by the court of a foreign country with which the petitioner has some genuine connection (*see* *g*) that he or she was born or is resident there even if not domiciled there (*see* D11(2)) at the time of the foreign divorce.

And under the Matrimonial Causes (War Marriages) Act 1944

(e) In the special case of marriages celebrated during the Second World War where (i) the husband was at the time of the marriage domiciled outside the United Kingdom, (ii) the wife was immediately before the marriage domiciled in England, and (iii) the parties never resided together in the country which was the husband's domicile at the time of the marriage the Divorce Division may deal with proceedings for divorce or nullity as if both parties were at all material times domiciled in England. (This provision was to cover the special cases of soldiers from the Dominions or Colonies the United States or other foreign countries who while stationed here during the War married English girls and had to go back to their own countries leaving their wives behind—in some instances without communicating with

them again.) (This Act applies only to marriages between 3 September 1939 and 1 June 1950.)

Housekeeping Allowances—If any question arises as to the right of a husband or wife to money derived from any allowance made by the husband for housekeeping or any similar expenses or to any property acquired out of such money the money or property (in the absence of agreement to the contrary) shall be treated as belonging to them both in equal shares. (The old rule was that the wife's savings out of housekeeping allowances belonged to the husband.)

Matrimonial Homes—The Matrimonial Homes Act 1967 protects the rights of either spouse to remain in occupation of the matrimonial home even if it belongs to the other spouse. If already in occupation he or she is not to be evicted except with leave of the Court if not in occupation he or she may enter and occupy the home. The Court has power to enforce restrict or terminate these rights having regard to the conduct of both spouses their needs and financial resources those of the children and all the circumstances. The Court's powers include the right to except part of the home from a spouse's occupation to order one spouse in occupation to make periodical payments in respect of such occupation and to impose on either obligations for repairing maintaining or discharging liabilities on the home. Any payment made by the occupying spouse towards satisfaction of the other spouse's liabilities for rent rates mortgage payments etc. shall count as if it were made by the other spouse. Occupation of the home by one spouse shall be treated as possession by the other spouse if he or she is protected by the Rent Control provisions (D25(2)) but this shall not affect any right of the occupying spouse against the other under any Act or Order. These rights are to last only so long as the marriage subsists unless provision is made for such rights to be a charge on the other spouse's ownership or lease or the Court makes an order (under the Matrimonial Proceedings and Property Act 1970) for transfer of ownership of the home to the other spouse or to settle it (D23(2)) for her or his benefit. In deciding how (if at all) to exercise this power the Court must have regard to each party's contribution to the family's welfare including looking after the home and caring for the family not necessarily by payment in money.

If one spouse is entitled in law to occupy the house as owner or lessee the other spouse's rights of occupation shall be a charge on the first spouse's title (D26(2)) from the date of acquisition of the right the marriage and the coming into force of the Act. The right shall be terminated (a) by death of the second spouse or (b) by the termination of the marriage (unless the Court otherwise orders). Any surrender of ownership or tenancy shall be subject to these rights so also shall bankruptcy of the owner or lessee. The rights on any one home may be registered at the Land Registry for the second spouse's protection only a mortgagee (D26) can enforce his rights against both spouses.

If the owner or lessee contracts to sell or let his legal estate (D27(1)) in the home such registered charge must be cancelled before vacant possession can be promised. The Chief Land Registrar shall cancel the charge if either spouse is dead or on a divorce or nullity decree (D32(2)) or under a Court Order. A spouse entitled to such protection may release his or her rights in writing.

If the Rent Control Acts (D25(2)) apply and there is a decree absolute (D32(3)) of divorce or nullity the Court may direct that the ownership or lease be transferred to the former spouse if he or she was not already owner or lessee and the originally protected spouse shall no longer be protected. Or the Court may direct that both spouses together or separately shall be liable for any obligations in respect of the home, but the landlord must have an opportunity of being heard by the Court. (This paragraph does not affect the rights referred to in the first paragraph.)

(Note Broadly these provisions prevent a husband or wife who is owner or lessee of the matrimonial home from turning out the other spouse after the marriage has broken up.)

LEGITIMACY AND ILLEGITIMACY

Until about 40 years ago illegitimacy (or bastardy) was regarded as a disgrace both for mother and child. It also brought great financial disadvantages. This state of affairs has been gradually remedied and today the rights of an illegitimate child are almost the same as those of the legitimate.

I The Status

From very early times legitimacy and illegitimacy have been questions of status (D11(2)). In the legal systems of most countries it was based on the Latin maxim *Mater semper certa est, pater incertus* that is it is always certain who is a child's mother but who is its father is uncertain. The reason is obvious: midwives doctors or relatives are nearly always present when a child is born and actually see the child issuing from the mother's body. But even when a child is born to a married woman living with her husband—still more when she is unmarried—doubts may arise as to the father's identity since no third party is present when sexual intercourse takes place and there is always a possibility that even an apparently respectable married woman may have had sexual relations with some other man as well as with her husband at about the same time (about 270–300 days) before the birth. Therefore the question of paternity (fatherhood) is one of *inference and deduction* although in the vast majority of cases where married couples are living happily together no question arises: the husband takes it for granted that the child is his. But there are some wives who commit adultery (D31(1)) and some have relations with a man other than the husband as well as with him at about the time of conception. In such cases the wife may herself be uncertain which of the two men has fathered her child. In nearly all legal systems the relevant date to establish legitimacy (as we shall see) is nearly always the date of the child's birth even if it occurs only a few weeks after marriage so that intercourse between a man and an unmarried girl may produce a legitimate child provided it is born at any time after the marriage takes place. (In England it is estimated that a substantial proportion of brides are already pregnant on the wedding day but this does not normally prevent the child from being born legitimate unless the husband (more rarely the wife) produces *clear evidence* that he is not the father.)

In the Canon Law of the early Catholic Church these considerations gave rise to the second maxim—*pater est quem nuptiae demonstrant*—that is fatherhood is proved by marriage. This prevented a man not married with the blessing of the Church to the mother at the date of the child's birth from being regarded as the legal father though *civil law* quite early recognised that (1) not the man who was the husband when the child was born but some other man was the natural father if the wife had been unfaithful. (2) If the mother was still unmarried when the child was born there was a natural father (who might or might not be easily found and willing or unwilling to marry the mother *after the birth*). In both cases the child was and is illegitimate obviously (1) is more difficult to prove if husband and wife are or were living together at the date of birth or conception than (2) where the facts of the mother's unmarried status when the child is born and of the actual birth taking place are easily proved by witnesses. For these reasons the civil law quite early in history abandoned the Church's rule that fatherhood is proved by marriage. There was a legal presumption (1) that the husband living with a married woman at the date of birth was the father of the child however soon after the marriage the birth took place and the child was regarded as legitimate unless clear evidence could be produced to disprove the presumption beyond all reasonable doubt (as in criminal law—D9(2)). (2) That a child born to an unmarried woman was illegitimate.

II Instances

Many people famous in history have been born illegitimate. Charlemagne (742–814) emperor of the Holy Roman Empire had no less than four mistresses as well as four wives: all the former bore him illegitimate children many of whom became rulers or princes of great States. William I of England (the Conqueror) was the bastard son of Duke Robert (nicknamed the Devil) of Normandy: his mother was the daughter of a tanner. In the 12th century Sir Robert Faulconbridge was the reputed father of an illegitimate son in Shakespeare's play *King John*; he is called Philip the Bastard and was suspected to be the illegitimate son of Richard I (*Cœur de Lion*) in the play he is shown as a noble character a great warrior and patriot. Don Juan of Austria victor in the Battle of Lepanto (1571) when the allied Christian fleets defeated the Turkish (Moslem) armada was the bastard son of the Hapsburg emperor Charles V.

Philip the Bastard and was suspected to be the illegitimate son of Richard I (*Cœur de Lion*) in the play he is shown as a noble character a great warrior and patriot. Don Juan of Austria victor in the Battle of Lepanto (1571) when the allied Christian fleets defeated the Turkish (Moslem) armada was the bastard son of the Hapsburg emperor Charles V.

III Legitimation

As there is nothing that our Parliament cannot lawfully do (D8(1)) it did on rare occasions pass *Acts to legitimate bastard children* of great families. One such Act in the reign of Richard II (1381–99) legitimated the bastard offspring of John of Gaunt Duke of Lancaster but without giving them the right of succession to the Crown. King Charles II was the natural father of many bastard sons by different mistresses several of whom were raised to the peerage among them the Dukes of Grafton St Albans Richmond Monmouth and Buccleuch.

Moreover for about a century past that part of our legal system known as private international law has recognised that since legitimacy is a question of status which in turn depends on *domestic* (D11(2)) if the father of a bastard was at the date of its birth domiciled in a foreign country under the law of which the child could be legitimated by the subsequent marriage of its parents then English law would recognise the child as legitimate either from its date of birth or from the date of the marriage. (In Scotland the same rule operated but only from the marriage date. But apart from such exceptional foreign cases there was no way under English law until 1927 of legitimating a bastard except by an Act of Parliament which very few could succeed in getting passed.)

IV Disabilities of Illegitimacy

Until comparatively recent times the social and legal disabilities of an illegitimate child were considerable. He was *filius nullius* that is no body's child since he had no lawful (and often) no known father. Socially he lived under a lifelong stigma which made him a kind of second class citizen, for puritanical and narrow minded people often imputed to the child the sin of its mother: the sufferings of such a child have been graphically described by Charles Dickens in the persons of Oliver Twist and Esther Summerson in *Bleak House*. Under the Poor Law Act 1830 a mother was legally obliged to maintain her illegitimate child up to the age of 16 or (if it was a girl) until its marriage. But in those days an unmarried mother besides the disgrace of her position found it difficult or impossible to find a situation which would allow her to maintain her self and keep the child with her. Adoption (D38–41) was then unknown so that in too many cases the child and often the mother too found themselves in the workhouse. Even if the father was known and traced there was then (as between him and the mother) no duty for proper maintenance unless he voluntarily made a binding contract (D18(1)) with her to contribute to the child's support but this came to an end on the mother's death.

Although there was legislation, dating back to 1576 requiring the natural father of the child (if

he could be traced) to share the mother's financial responsibility, this remained for nearly three centuries intimately bound up with the Poor Law—the object being not to give the mother a legal remedy against him but to prevent the cost of the child's maintenance from falling on the Parish.

V Removal of Financial Disabilities

Not until the Bastardy Act 1845 was the mother given an independent remedy against the putative (supposed) father without the intervention of the Poor Law authorities. By the Act of 1845 amended in 1872–3 1914 1918 1923 1927 and 1960 the mother has been able to issue a summons before a magistrate or J.P. (D43) against the putative father assuming she could prove his paternity she could get an order (now called an affiliation order) for him to pay a sum raised in 1957 to a maximum of 50/- a week towards the child's maintenance up to the age of 16. By the Maintenance Orders Act 1960 this maximum was abolished and the sum awarded is now entirely in the court's discretion depending on the means and conduct of the parties. The application may be made before the birth but cannot be entertained if made later than 12 months after the birth unless the putative father has within those 12 months paid money for its maintenance. Either party may appeal against the order its amount or its refusal from the magistrate or J.P.s to Quarter Sessions (D6) or on a point of law only to the Divisional Court (D5). The applicant must be a single woman but the courts have generously interpreted these words to include a widow, a divorced woman or a married woman living apart from her husband provided the child is clearly illegitimate. Thus a bastard child is now financially protected during the lifetime of its mother or its father if the case can be proved against him up to the age of 16.

It was still the law until recently that this protection ceased on the death of the responsible parent but by Part II of the Family Law Reform Act 1969 (with effect from 1 January 1970) on the death of such a parent intestate (without a will—D19(1)) an illegitimate child shares equally with any legitimate children in the intestate parent's estate and *vice versa* the parents from an intestate illegitimate child. If there is a will the words child son daughter mother

father and other words implying kinship are to include kinship through illegitimacy as well as legitimacy. Executors and administrators (D22(1)) of the deceased who have distributed the estate in ignorance of the existence of illegitimate children among the legitimate persons entitled to benefit are not liable to the former who may however follow the property into the hands of those who have received it and claim their lawful share from the latter. The right of certain illegitimate—as well as legitimate—dependants to claim reasonable provision from the estate of a testator who has made no provision or insufficient provision for them has already been noted (D19(2)). The same right has now (1970) been given to children of a void marriage (D30(1)) and to the surviving spouse of such a marriage. Thus the financial disabilities of bastardy are abolished.

VI Removal of Social Disabilities

The Legitimacy Act 1926 for the first time in English legal history permitted legitimization by subsequent marriage of the parents. It provided that if the natural parents of an illegitimate child (the father being domiciled (D11(2)) in England or Wales) should marry or have married each other *after the child's birth*, the child was legitimated—i.e. it became legitimate from 1 January 1927 (when the Act came into force) or from the date of the marriage whichever was later. The birth of such a child could be registered as legitimate with the Registrar of Births Marriages and Deaths but failure to register did not prevent legitimization. However the subsequent marriage of the natural parents could not under that Act legitimate the child if one of them was married to a third party at the

date of the child's birth. This remained the law until the exception was abolished by the Legitimacy Act 1959 (as from 29 October of that year) the 1959 Act also provided that any child of a void marriage (D30(1)) whenever born should be treated as the legitimate child of its parents if at the time of the sexual intercourse resulting in the birth or the date of the marriage if later both or either of the parents reasonably believed the marriage was valid. Thus there is now practically no social disability attaching to an illegitimate child.

VII Evidence of Paternity

We have seen (I above) that while maternity is easily provable fatherhood is not that (1) the man who was the husband of a married woman when a child was born was for many centuries regarded as its father and the child as legitimate unless there was clear evidence to the contrary (2) the child of a single woman including one living apart from her husband at the date of birth was generally regarded as illegitimate. But in the past forty years or so questions have often arisen in the courts not only whether a child is legitimate or not but who is its natural father. Such questions might arise (1) where the child's mother is married and living with her husband but is shown to have committed adultery at the presumed time of conception in which case the husband may deny his paternity (2) where the child's mother is unmarried but has had intercourse with more than one man at about that time. *Direct evidence* of fatherhood is hard to come by.

In 1924 when many financial and social disabilities attached to illegitimacy the House of Lords on appeal (D5) decided the case of *Russell v Russell*. In the lower courts the husband had denied paternity of the child born to his wife although they were living together at the time of conception by giving evidence in a divorce suit on the grounds of the wife's alleged adultery of sexual practices between him and his wife not amounting (as he said) to proper intercourse sufficient to beget a child. The Lords decided that it was indecent and intolerable that evidence of non-intercourse between a married couple living together should be given by either of them tending to bastardise a child born in wedlock. That decision binding on all courts (D7(1)) became part of the law of England. It was so strictly interpreted that even during the second world war neither husband nor wife could give evidence of non-access (i.e. husband and wife not living together) even if the husband had been abroad when the child was conceived on active service though the country's defence authorities or strangers who knew the facts could do so. This rule remained in force until it was abolished by the Law Reform (Miscellaneous Provisions) Act 1949 (now sec 43 of the Matrimonial Causes Act 1965). Similarly for the protection of a child born in wedlock while the spouses were living together the legal presumption that (I above) such a child was legitimate unless the contrary was proved beyond all reasonable doubt held good until the passing of the Family Law Reform Act 1969 sec 26 of which provides that any presumption of law as to the legitimacy or illegitimacy of any person may in any civil proceedings be rebutted (i.e. contradicted) by evidence which shows that it is more probable than not that that person is illegitimate or legitimate as the case may be and it shall not be necessary to prove that fact beyond reasonable doubt in order to rebut the presumption.

VIII Blood Tests

The reasons for these relaxations of the strict rules of law relating to proof of illegitimacy are principally that (1) the disabilities of illegitimacy (V and VI above) have now practically disappeared (2) the progress of medical science has in the past 20 years made it possible for specialists to say with a 70 per cent degree of probability that a particular man is *not* the father of a particular child. Since 1901 researches of the serologist Dr Landsteiner and his successors have been developed and have now reached a point

where by investigating the blood groups (see index to Section P) of a child its mother and one or more men a specialist can say with comparative certainty (a) that a particular man is not the father of a particular child or (b) with almost complete certainty that of two men one is less likely to be the father than the other. Without going into medical technicalities it can be said that if it is found that a child's blood contains some constituent or characteristic absent from the blood of both its mother and her husband or of the putative father *he cannot be the natural father of the child.*

In the past twenty years evidence based on voluntary blood tests has become acceptable by the courts (a) in cases involving the suspected adultery of a wife and non paternity of her husband (b) in cases where a single woman has given birth to a child and it is uncertain what man is its father. Where *all the parties willingly* have submitted themselves and the child for blood tests no difficulty arises the results of the tests are part of the evidence admissible in the court hearing the case. But these tests cannot prove who is the father but only who is not. Nevertheless such tests have in recent years become a valuable source of evidence provided that all parties involved have submitted to tests.

The difficulties begin (a) if one or more of the parties refuses to submit himself or herself for a test or (b) if the person having custody of the child refuses to have it blood tested. To obtain a blood sample only a very slight surgical operation is required but (a) in the case of an adult even the slightest surgical operation performed on him or her without consent would be an assault and battery (D18(1)) therefore the courts and the Law Commission have resolutely set their faces against physical compulsion or punishment of any kind for refusal to take a test. But the Family Law Reform Act Part III (which will not come into force until the Lord Chancellor exercises the power that the Act gives him (D8-9) to bring it into operation when he thinks fit—probably not before the spring of 1971) confers on the courts power to direct the use of blood tests on the application of any party whenever the paternity of a child has to be determined in any civil proceedings. Part III of the Act briefly sets out the proposed procedure and confers power on the Home Secretary to issue regulations (D8-9) on the details. But the Act lays it down that (1) no blood sample is to be taken from any person without his consent if he is over 16 (2) in which case his consent shall be as valid as if he had attained his majority (D12(1)). (3) A blood sample may be taken from anybody under 16 (not suffering from mental disorder) with the consent of the person having his or her care and control. (4) If a person is suffering from mental disorder and cannot understand the nature and purpose of blood tests the person having his care and control must consent and the medical practitioner in charge of his case must certify that taking a blood sample will not prejudice his care and treatment.

But what if a person over 16 not suffering from mental disorder fails or refuses to obey the court's direction to take any step to enable blood tests to be made? The answer appears in sec. 23 of the Act in such event the court may draw such inferences if any from that fact as appear proper in the circumstances. It is also provided that if in any proceedings in which paternity is to be determined the court gives a direction for a blood test to be taken and any party involved who would normally be entitled to rely on the presumption of law that a child is legitimate fails to take any step required of him to give effect to the direction the court may adjourn to enable him to take that step. If at the end of the adjournment he has unreasonably failed to take it the court may dismiss his claim for relief notwithstanding the absence of evidence to rebut the presumption. And if a person named in a direction fails to consent to the taking of a blood sample from any person of whom he has care and control he shall be deemed to have failed to take such a step. In other words the court may draw the conclusion that the person refusing is doing so because he fears that the test if made would be against his or her case. So for example if a married mother refuses to submit herself or her child to a blood

test the court may assume that it is because she fears that such a test might help to provide evidence that her husband is not the father and so forth. These rules should help to deter adult parties from refusing to comply with the court's direction in a case where a child's paternity is disputed.

(b) As regards minors under 16 particularly *children of tender years* there have been both before and since the Act was passed but before Part III has come into force conflicting decisions in the High Court and the Court of Appeal on the question whether it is right and proper for the courts to direct the taking of a blood test on a young child especially if it is under 4 or 5 years old. Since equity (D7(2)) took a special interest in the welfare of young children who could not protect themselves—an interest which it exercised before the Judicature Act 1873 (D8(1)) through the old Court of Chancery but after that Act through any High Court Judge (D8(1))—it has been customary in any case concerning the custody upbringing or welfare of a young child to appoint a guardian *ad litem* (for the purposes of the case) to argue on the child's behalf its own interests which may be different from those of its mother or father (see (a) above). As a result of such arguments in various cases some Judges have held (i) that it can never be equitable (D7(2)) to order a blood test on a child born in wedlock which may help to provide evidence that its mother was lying when she said her husband was the father and that it is almost certainly not the offspring of the husband but of an adulterer. (ii) Conversely other Judges have felt that in all doubtful cases the child itself will at some time be anxious to know who is its natural father—a question which ought not to be decided by the court on *partial evidence*—excluding the scientific and up to date evidence of blood tests—assuming that all the adult parties are willing to submit themselves to tests above all that if a woman is suspected of adultery her husband will leave the court with a sense of grievance and injustice and never treat the child as his own in a fatherly way if such clear up to date scientific evidence is excluded.

Two such cases *W v W* and *S v S* in which majorities of two Judges to one in different Courts of Appeal had given conflicting decisions came before the House of Lords (D5) in July 1970. The five Law Lords unanimously decided in favour of view (ii) above. Lord Reid who delivered the principal speech dealt with the whole history of the subject which we have outlined above and emphasised that the former financial and social disabilities of illegitimacy have now practically disappeared. In large towns nobody knows or cares whether a newcomer is legitimate or illegitimate one hopes that prejudice is decreasing. Some children may grow up sensitive or resentful at having been born illegitimate others not. No one can foretell whether the child would resent the evidence having been suppressed or not. On the whole it is better that the truth should out. Courts should permit blood tests on a young child unless satisfied that it would be against the child's interest—a young child because as soon as it was old enough to understand it would generally be unwise to submit it to the test against its will. The court must protect the child but it is not really doing so by banning a test on some vague or shadowy conjecture that it might turn out to its disadvantage. A parent can lawfully use constraint to his young child if it is not cruel or oppressive so why cannot the courts?

Lords Reid and Hodson added some words which have left part of the question in doubt. They did not believe that Part III of the Act was intended to grant power to magistrates courts (in affiliation cases) and designated county courts (D29(3)) in undefended divorces to order blood tests on young children as the rights of protection formerly exercised by the Court of Chancery had been transferred by the Judicature Acts (D8(1)) only to the High Court. There is however nothing in the 1969 Act which defines or restricts the meaning of the court nor in the Law Commission's recommendations. The resolution of this doubt must await the Lord Chancellor's order (above) probably in the spring of 1971 and the Act may be amended.

ADOPTION OF CHILDREN

Adoption is the act of a person who takes upon himself the position of parent to a child who is not in law his own legitimate child. It has been for centuries very common in India and most Continental countries and for over a hundred years in most parts of the United States. It was recognised by the laws of Greece and Rome from early times. Julius Caesar adopted his grand nephew Octavian (afterwards the Emperor Augustus) in 46 B.C. But there was no provision for adoption under the Common Law of England (D4). The transfer of parental rights and duties in respect of a child to another person was unknown to our law until 1926 when the first of a series of Adoption Acts was passed. There have been a number of amendments since then. The present law is mainly contained in the Adoption Acts 1958 and 1968. Informal adoption outside the Acts is invalid. (But under the Adoption Act 1968 adoptions effected under the law of certain foreign countries may be recognised by the English courts.)

The procedure for adoption is as follows

- (1) Approach by would-be adopters to a registered Adoption Society or Local Authority for help in adopting a child and explanations of their qualifications
- (2) Investigations of suitability of persons and home including medical matters and notification to parent(s) of eventual need for formal consent and effects of Order when made
- (3) Informal consent of parents or guardian to handing over of child to would-be adopters on trial
- (4) Actual handing over of child to would-be adopters on trial
- (5) Formal application by would-be adopters to a Court
- (6) Formal consent of parents to adoption
- (7) Hearing by the Court. If an Order is refused and there is no appeal the child must be returned to its parent(s) or to the Local Authority if the parents are unsuitable. There may be an appeal while the child is still in the hands of the Applicants to the Court of Appeal and the House of Lords. If the original application or appeal succeeds an Order is made. Then and only then is the child adopted.

We shall now explain the sequence in more detail.

Applications for Adoption.—The would-be adopters (the Applicants) normally approach a registered Adoption Society or a County Council or County Borough Council to make and participate in adoption arrangements which must eventually be confirmed by an Order of the High Court or a County Court or a Magistrates' Court hearing juvenile cases. The Adoption Society or Local Authority carefully investigates the suitability of the Applicants, interviews them and sees their home and ascertains the religion in which the parents wish the child to be brought up. The Applicants must produce a certificate from a registered medical practitioner to the effect that they are in good health as must the parents of the child to certify that its health is good. The Society or Local Authority must hand the parents a memorandum in ordinary language explaining the effects of an Adoption Order if made by the Court and calling attention to the parents' formal consent being eventually required. Such consent may be withdrawn at any time before the Order is actually made but may be dispensed with by the Court on special grounds (see below).

If all these preliminary matters are satisfactory the Society or Council may hand the child over provisionally to the Applicants for a trial period of not less than three consecutive months preceding the Order if made, but no period is counted before the child is six weeks old. No

maximum period is laid down by law within which the Applicants must apply to the Court. This is regarded by reformers as a serious defect in procedure. They consider that there should be a maximum period of (say) six months within which the Applicants must apply to the Court for an Order and the parents should be compelled to decide within that period whether or not they are prepared to give formal written consent to the proposed adoption. (The Home Secretary appointed the Houghton Committee in 1969 to consider the law, policy and procedure on the adoption of children. The review will include such issues as whether relatives should be able to apply for guardianship instead of adoption, the relation between adoption law and that part of guardianship law which gives the natural father of an illegitimate child the right to apply for custody and in particular the position of long-term foster parents who wish to keep a child permanently against the wishes of the natural parents. The Committee has published its preliminary proposals as a working paper for consideration and comment by all persons and institutions interested. A brief summary of these preliminary proposals is given at the end of this article (D40-1).)

Formal consent may be dispensed with by the Court if a parent or his or her wife or husband cannot be found, is incapable of consenting or is living apart in what seems likely to be a permanent separation. A parent's consent may also be dispensed with if he or she has abandoned, neglected or ill-treated the child or is 'unreasonably' refusing consent. If the parent does not attend the Court hearing, that consent must be given in writing, witnessed by a J.P., County Court officer or Magistrate's Clerk, or outside England by a British Consul or Vice Consul or foreign Notary.

None of the provisions relating to consent applies to the proposed adoption of a child who is not a U.K. national, but such adoption must conform to the internal law of the country of which he is a national (Act of 1968).

As soon as an application to the Court is filed by the Applicants the Official Solicitor (or in Magistrates' Court cases the Children's Officer of the Local Authority) is appointed the child's guardian *ad litem* (i.e. a guardian for the purpose of the proceedings who looks after the interests of the child without regard to those of anybody else). If no appointment for the Court hearing is made within 15 days from the application to the Court, the guardian *ad litem* must apply for the Court's directions (this is a new rule to avoid executive delay). The Court then hears the case *in camera* (i.e. in private, the public not being admitted) and has a complete discretion either to make or to refuse an Adoption Order. If refused and there is no appeal, the child must be returned to its parent(s) or if they are unsuitable, placed in the care of the Local Authority. If an Order is made or the Applicant(s) successfully appeal the child remains with the Applicant(s) only on the making of an Adoption Order by the Court is the child legally adopted.

Adoption Orders.—The High Court (Family Division), a County Court or a Magistrates' Juvenile Court may make an Adoption Order authorising an Applicant in the prescribed manner to adopt a child. An Order may be made on the application of two spouses jointly or by one spouse with the consent of the other spouse, but in no other case may an Order be made in favour of more than one person. (Dispensing with consent—see above.) An Order may be made authorising the adoption of an illegitimate or legitimated child or the re-adoption of an already adopted child (e.g. in case of the death of the Adopter(s)) by his or her mother or natural father either alone or jointly with his or her spouse. This facilitates the adoption of illegitimate or legitimated children and puts them (for record purposes) on a par with legitimate children who have been adopted. (A legitimated child is one born out of wedlock but whose parents have subsequently married.)

An adoption Order may not generally be made

in England unless the Applicant and the child are living in England. (But see Act of 1968 above.) Nor may an Order be made unless the Applicant (or one of two Applicants) is (a) the mother or father of the illegitimate or legitimated child (with the other parent's consent) or (b) a relative, i.e. a grandparent, brother, sister, uncle or aunt of the child, or a person who would be such relative if the child were the legitimate child of its mother or father, or of former adopters and such relative is aged 21 or over, or (c) in any other case is 25 years old or more. On the application of a sole male Applicant to adopt a female child, no Order may be made unless the Court is satisfied that there are special circumstances justifying an Adoption Order as an exceptional measure.

No Adoption Order may be made unless the child has been continuously in the care and possession of the Applicant for at least three consecutive months immediately preceding the Order (not counting any time before the infant is six weeks old); this is subject to the safeguards detailed below as to supervision of a protected child. (But in the case of Applicants domiciled (D11) outside Great Britain who desire to adopt an infant under the law of the country of domicile and to obtain a provisional Adoption Order in England, the child may be taken or sent abroad for the purpose first mentioned and the period of three consecutive months is extended to six.) Except where one of the Applicants is a parent of the child, no Order is to be made in respect of that child who at the hearing is below the upper limit of the compulsory school age unless the Applicant has given notice in writing to the Local Authority of his intention at least three months (in cases of provisional adoption six months) before the Court Hearing.

Formal Consents Required.—No Order may be ordinarily made without the consent of every person who is a parent or guardian of the child (which may be given either unconditionally or subject to conditions as to the religion in which the parent or guardian requires the child to be brought up). Even so, the consent of the parent or guardian may be dispensed with (see above). Where a parent or guardian has given informal consent without knowing the identity of the Applicant(s) and subsequently withdraws his or her consent solely on this ground, he or she is deemed to be withholding consent unreasonably. (See also Act of 1968 above and preliminary proposals of the Home Office Houghton Committee (D40).)

Matters on which the Court must be satisfied.—Before making the Order the Court must be satisfied

(a) that every person whose consent is necessary and has not been dispensed with has consented to and understands the nature and effect of the proposed Adoption Order, in particular that every parent understands that the effect will be to deprive him or her permanently of his or her parental rights;

(b) that the proposed Order will be for the child's welfare;

(c) that the Applicant has not received or agreed to receive and that no person has made or given or agreed to make or give any payment or other reward in consideration of the adoption, except such as the Court may sanction (if any).

As to (a) the Court must have regard to the Applicant's health to be evidenced by the certificate of a fully registered medical practitioner; the Court shall also give due consideration to the wishes of the child, having regard to his or her age and understanding. The Court may impose such terms and conditions as it thinks fit, including a requirement that the adopter shall make such financial provision for the child as is just and expedient. It may postpone a decision on the application and make an interim order giving the Applicant custody of the child for a probationary period not exceeding two years, upon such terms as it may think fit for the maintenance, education and supervision of the child's welfare. The same rules apply to an interim order for custody as to consent and dispensing with consent as for a final

F (30th Ed.)

Adoption Order, but the Court may not make an interim order without the three months' care and possession and notice to the Local Authority as are provided above. An interim custody order for less than two years may be extended to the full two years but no longer. An interim order for custody is not an Adoption Order.

Procedure and Appeals.—To safeguard the child's interests during the hearing the Court has to appoint a guardian *ad litem* (see *Applications for Adoption* para 5).

Effects of Adoption Orders.—Upon an Order being made all rights, duties, obligations and liabilities of the parents or guardians in relation to custody, maintenance and education of the child, including rights to appoint a guardian by will to consent or refuse consent to its marriage, shall be extinguished, and all such rights etc. shall be exercisable by and enforceable against the Adopter(s) as if the child were his or her or their legitimate child and the child shall stand to the Adopter(s) in the same position. If two spouses are the Adopters they shall stand to each other and to the child (for the purpose of court orders for custody, maintenance and right of access (D38(1)) as if they were the lawful father and mother and the child shall stand to them in the same relation.

For the purpose of the marriage laws, an Adopter and Adoptee shall be regarded as if they were within the prohibited degrees of blood relationship—except if a later Adoption Order is made in favour of another person (i.e. an Adopter may not in any circumstances marry the Adoptee).

Succession to Property.—If after an Adoption Order the Adopter or Adoptee dies without a will in respect of any property the property shall devolve as if the Adoptee were the lawful child of the Adopter (D21-3) and not the child of any other person. In any disposition of property made by will codicil or settlement (D21-38) after an Adoption Order a reference to the child or children of the Adopter shall include a reference to the Adoptee (unless the contrary intention appears). The will or codicil is treated as having been made at the Adopter's death. But any reference to the child or children of the natural parents (or either of them) shall not include a reference to the Adoptee. And any reference to a relative of the Adoptee shall (unless the contrary intention appears) be regarded as a reference to the person who would be such a relative if the Adopter were his lawful parent. (But these provisions do not apply to any dignity or title of honour—e.g. a hereditary peerage.)

For the purposes of the Administration of Estates Act 1925 (D21-3) an Adoptee shall be regarded as a brother or sister of any child or adopted child of the Adopter. Executors and administrators (D21-3) are not liable if they distribute the estate of the Adopter without ascertaining that no Adoption Order has been made, but the Adoptee may sue the beneficiary for the Adoptee's share of the property if there has been more than one Adoption Order, the earlier adoption shall be disregarded.

Citizenship.—If the Adoptee was not a citizen of the United Kingdom and Colonies (D11) but the Adopter or male Adopter is the Adoptee shall be such a citizen as from the date of the Adoption Order.

Registration.—The Registrar General is to keep an Adopted Children's Register to contain authorised entries but no others. A certified copy of the entries counts as evidence; the index may be searched by anybody who may obtain a certified copy of any entry. No other record may be seen by the public without a Court Order. Every entry shows only its number, date and country of birth of the child, the name and adopted surname of the child and of the Adopters, the date of the Adoption Order and of the Court, the date of entry and signature of the Registrar. The word "adopted" or "re-adopted" is written against the name of the child in the Register of Births.

but this shall be cancelled if an Adoption Order is refused or an appeal against adoption succeeds.

If a child adopted by its mother or natural father is subsequently legitimated by their marriage the Court of Adoption may on their application revoke the Adoption Order and the entries in the register and any certificate shall be cancelled (and the parents' names substituted).

Local Authorities and Adoption Societies—Except for the Local Authorities or registered Adoption Societies mentioned at the commencement of *Applications for Adoption* para 1 no other body may make adoption arrangements and even the authorised bodies may not place the child in the care and possession of a would-be adopter if the last named person could not lawfully adopt him under the penalty of a fine of £100 or six months imprisonment and the Court may order the child to be returned to his parent(s) or guardian(s) or to the Local Authority or registered Adoption Society. There are strict provisions as to which Adoption Societies may be registered or struck off the register and as to appeals.

Care and Possession of Infants awaiting Adoption—While an application is pending a parent or guardian who has assented may not without the court's leave remove the infant from the care and possession of the Applicant; the Court will not give leave without considering the infant's welfare. The parent(s) or guardian(s) may not take back an infant in the care and possession of any Applicant before the actual Adoption Order and must give written notice to the Authority or Society (before an Adoption Order is made) of the parent's or guardian's intention to part with the child in which case the child must be handed to the Applicant(s) through the Authority or the Society. Only in cases where the adoption application is refused by the Court or on appeal may the child be returned to or retained by the parent or guardian.

Supervision—Where arrangements have been made for placing a child below the upper limit of compulsory school age in the care and possession of a stranger or where notice of intention to apply for an Adoption Order is given then the child is known as a protected child while it is in the care and possession of a stranger but not if it is in an Approved School or some other home under the Children's Acts. The child ceases to be a protected child at the age of 18 or on the making of an Adoption Order. It is the duty of every Local Authority to see that every protected child is periodically visited by its officers who shall satisfy themselves of the child's well-being and give such advice as may be needed. The officers must produce a document of authority and may then inspect any premises where the child is kept or to be kept. It is the duty of any stranger to give notice of all arrangements with regard to protected children including any change of address and particulars of the name, sex, date and place of birth and name and address of the parent(s) or guardian(s) or person(s) from whom the child is received. In the event of a protected child's death the person(s) having care and possession must give written notice to the Authority. If neither the Local Authority nor a registered Adoption Society took part in the arrangements and it appears to the Authority that such arrangements would be detrimental to the child the Authority may in writing prohibit the proposed Adopters from keeping the child in any premises subject to appeal to a Juvenile Court. If the Court is satisfied that a protected child is received or about to be received by an unfit person, or in non-approved premises, the Court may order his removal to a place of safety until he can be restored to his parent(s) or guardian(s) or relative(s). On proof that there is imminent danger to the child's health or well-being this power may be exercised by a J.P. A Local Authority may receive any child so removed (even if not a protected child and even if he is over 17) informing the parent(s) or guardian(s) of what has been done. There are heavy penalties for any contravention by a stranger of these provisions.

A warrant may be issued in the event of refusal to allow a visit or the inspection of premises by an authorised person.

General—It is generally unlawful to give any payment in consideration of the adoption of a child any grant of consent (i.e. formal or informal) in connection therewith the transfer of care and possession the making of arrangements for adoption—penalty fine £100 and/or six months imprisonment but this does not apply to payment of a registered Adoption Society's expenses or any payment authorised by a Court. No advertisement may be published indicating the desire of the parent(s) or guardian(s) to have his/her or their child adopted that a person desires to adopt a child or that any person (except a Local Authority or registered Adoption Society) can make such arrangements—penalty fine £50.

Detailed Court Rules have been made for the carrying out of these arrangements.

There are five Schedules to the 1958 Act. Schedule III, the most important sets out the nature and purposes of the Regulations which every Adoption Society must have.

Every Adoption Society must set up a case committee of not less than three to consider each individual case.

No child shall be delivered to the proposed Adopter until the latter has been interviewed by the case committee who must inspect the premises where the child is to live permanently after all the reports have been considered.

Every Society must furnish a report on its activities and the prescribed accounts.

Provision must be made for the care and supervision of any child placed with a Society with a view to adoption.

There is a prohibition of or restriction upon disclosure of records kept by the Society and provision for their safe keeping.

Home Office (Houghton) Committee's Preliminary Proposals (October 1970)—One unsatisfactory feature of the present law is that the Courts have held in certain cases that the rights of natural parents to oppose an adoption order or to withdraw consent already given at the last moment just when the Court is about to make an order must be preserved. This has meant that the welfare of the child is not at present the first and paramount consideration in adoption as it is in cases of custody (D33(1)) and guardianship (Guardianship of Infants Act 1925 sec 1).

(1) The Committee recognises that the child's need above all is for security especially if a conflict arises between the natural parents and the would-be adopters. The Committee's first proposal is that the law should be changed so as to ensure that the welfare of the child comes first having regard to the family's situation as a whole. The child's welfare cannot be regarded in isolation from the family generally including brothers, sisters and other relatives as well as parents. (Some readers may remember the unhappiness of the little Fanny Price in Jane Austen's *Mansfield Park* on being taken away to be brought up by her rich aunt and uncle miles from her home and separated for a long time from her brothers and sisters.) If on consideration in this light the best long term solution for the child's welfare consists in severing parental and family ties permanently the law should not stand in the way. The long term welfare of the child should be the first and paramount consideration. The length of time he may have been with foster parents or would-be adopters is one but not the only important factor. His emotional relationship with his natural family must also be considered in each individual case.

(2) Further consideration should be given to the possibility of allowances and subsidies for guardians and adopters in approved cases (At present any form of payment is illegal.)

(3) When placing a child with would-be adopters, the local authority or adoption society

should pay some regard to the natural parent(s) wishes as to the religion in which the child should be brought up but the law should cease to permit them to make that question a condition of their consent to an adoption order.

(4) Although the number of adoption orders registered in England, Wales and Scotland rose from 14 668 in 1958 to 28 938 in 1968 it fell slightly in 1969 to 26 049. It appears that a higher proportion of unmarried mothers are keeping their babies and the tendency to reduction in the number adopted may be accentuated by the increasing use of contraceptives (e.g. the pill) and the legalisation of abortion in certain circumstances. There is required a nationally available adoption service focusing, primarily on the needs of children and forming an integral part of the comprehensive social services. Every local authority should secure the provision of such a service in its own area, as part of child care. The system of registration of voluntary adoption societies should be maintained and strengthened. The placing of a child with a view to adoption with non relatives should be permitted only to local authorities and authorised adoption societies.

(5) (a) The present minimum trial period of three months during which the child must reside with would be adopters before they can apply for an order (D38(2)) should be extended to one year and the consent of the local authority should always be obtained. (b) If for five years or more they have cared for a child they should have an absolute right to apply to the Court for an adoption order—in either case irrespective of the views of the natural parent(s). Change (a) is desirable because local authorities or voluntary organisations sometimes place a child with foster parents in cases where the natural parents have no thought of giving up their parental rights and responsibilities (e.g. because they are temporarily unable to secure living accommodation suitably extensive for the size of their families but have every intention of keeping the child with them as soon as they find a suitable home). (b) is desirable in order to prevent the risk of causing the child or the would be adopters to feel insecure.

(6) New provisions should be made by law for finalising the consent of the natural parent(s) not at the time when the Court is about to make the order but before the date of the hearing—in some cases even before the child is placed with would be adopters. This would be in the interests of the child both by diminishing the risk of his removal from the adoptive home at a late stage and also by lessening the anxiety of those who wish to adopt him—an anxiety which in itself can harm the child's developing relationship with its adoptive parents. But it is essential that there be safe

guards to ensure that the consent of the natural parent(s) is given freely with full understanding of its implications also that arrangements for the child's welfare be provided for if adoption is not approved.

(7) The child should always be told as he grows up that he has been adopted and his curiosity about his natural parents satisfied. More than one third of all adoptions are by unmarried mothers or other relatives these are fundamentally different from adoption by strangers. In the former kind of adoption the adopters already belong to the child's own family and are often already caring for him; this makes it harder to achieve openness between the adopters and the child. In the (few) cases where a child is adopted by his unmarried mother or (more rarely) unmarried father attempts by this means to conceal his illegitimacy from him or from the world at large (D40(1)) coupled with registration of the adoption and the issue of a new certificate instead of the birth certificate are likely to be damaging to him rather than helpful in the long run—see also *Illegitimacy* D35. And the apparent advantage of permitting such adoptions is outweighed by the disadvantages of cutting any link which exists with the other parent by means of access (D33(1)) and transforming a natural into an artificial relationship. In any case the unmarried mother already has custody and is responsible for him by law. Therefore it is doubtful whether it should still be permissible for a natural parent to adopt his or her own child.

(8) But to replace adoptions of this special kind opportunities for custody and guardianship should be extended. Such orders are not necessarily permanent in their effect and do not extinguish the legal rights and responsibilities of natural parents (they are therefore more appropriate in cases (5) above) where the natural parents are temporarily unable to have the child with them because of overcrowded accommodation. Guardianship has the advantage of conferring on the child the security which he needs since the guardian cannot be ousted without a Court order. It does not bewilder a child who has already got to know his natural parent(s) and there is no reason why a guardian if otherwise qualified should not later be able to apply for adoption. A step parent (after death or divorce of the natural parent) should be able to adopt the illegitimate child of his or her spouse provided this does not affect the latter's legal position as parent.

These preliminary proposals will be considered and discussed by professional people and others interested in the subject so that the Committee's final proposals may be published by the end of 1971 to enable new legislation to be prepared.

TREATMENT OF JUVENILES IN NEED OF CARE

Quite apart from the protection and welfare provisions for children of the family affected by matrimonial disputes (D33(1)) revolutionary provisions have been made by Part I of the Children & Young Persons Act 1969 for the treatment (a word which has taken the place of punishment) of delinquent or other children (under the age of 14) and young persons (between 14 and 17) in need of care. Part II of the Act deals with accommodation for children committed to the care of local authorities and foster children. In 1933 the minimum age of criminal responsibility (the age at which the law regards them as responsible for delinquent behaviour) was raised from 7 to 8 years by the Children & Young Persons Act 1933 it was again increased to 10. The Act of 1969 provides for raising the minimum age at which a child may be prosecuted (at present 10). The Government has announced its intention to specify the age of 12 as the age below which a child may not be prosecuted (but see last para. but one D42(2)).

Part I of the 1969 Act came mainly into force on 1 January 1971; other parts will take effect when the Home Secretary makes an authorised order. The Act was based on two Government White Papers (proposals for discussion and state

ments of intention)—*The Child, the Family and the Young Offender* (1965) and *Children in Trouble* (1968) and the Report of the Committee on Children and Young Persons (1960). The first proposed setting up Family Courts in place of Juvenile Courts but this created so much controversy that it was dropped. But the basic aim of reform has been fulfilled—to remove the stigma of criminality from children in trouble up to the age of 14. Instead of a prosecution (D9(1)) for what in an adult would be a criminal offence a local authority, a constable or an officer of the National Society for the Prevention of Cruelty to Children (a qualified person) may bring a child before a Juvenile Court (staffed by specially qualified and selected magistrates) in care proceedings. The need for care and control is a test which governs all the conditions (a) to (f) below. Such proceedings may be put in motion in cases of (a) truancy (b) suspected offences (other than homicide) (c) children and young persons beyond control of their parents or guardians (d) children and young persons who are ill treated or neglected or who are in moral danger where in addition they are in need of care and control which they are unlikely to receive unless the Court makes an order. Truancy.

cases must be brought by a local education authority. (A child under 6 need never appear before a court, though his parents or guardians must be present at the hearing.) In the case of a child or young person who is found to be in need of care and control (if he or she is not over 16 and is not or has not been married) the Court may make one of the following orders: (1) requiring a parent or guardian to enter into a recognisance (i.e. an undertaking supported by the penalty of forfeiting a sum of money if the condition is not fulfilled) to take proper care of him and exercise proper control over him; (2) a supervision order (see below); (3) a care order (see below); (4) a hospital order; or (5) a guardianship order. In all cases notice of the proceedings must be given to the local authority where the child or young person resides (unless it is the local authority itself which is taking the proceedings).

These *care proceedings* are (for the purpose of evidence) regarded as civil not criminal except in (b) above where the alleged offence must be proved beyond all reasonable doubt. (D9(2)) Other cases may be proved on a balance of probabilities (since no question of fault on the part of the child or young person may arise). In case (b) in addition to one of the orders (1) to (5) the Court may order the young person if an offence is proved against him or his parents or guardians (if they conduced to the offence by neglect) or order the parents or guardians of a child to pay compensation up to £100 to any injured party. An appeal lies to quarter sessions (D9).

The Act further provides that private prosecutions of children and young persons for alleged offences are prohibited. Court proceedings may be started only by a qualified informant—and then only if that informant is satisfied that the case could not adequately be dealt with by a parent teacher or other person by means of a police constable's caution or by action on the part of the local authority (which must be consulted in all cases) without proceedings. Full names of the offenders' age must be given to the Court in a written statement which must also certify the points above mentioned in this paragraph if it fails to do so. The Court shall quash (i.e. cancel) the proceedings if the accused is under 17 he shall be tried summarily (i.e. by the Juvenile Court itself)—not sent for trial by Judge and jury except in cases of (1) homicide (2) certain grave crimes attracting long periods of detention (see below) or (3) a joint charge together with another person of 17 or over and the Court thinks that justice requires that they both be committed together for trial by judge and jury in any of which cases they shall be so committed. If the accused is found guilty summarily he may be fined up to £50 placed on probation or under supervision or sent to detention for 3 months or less. The Act makes provision for the minimum age for borstal training to be raised from 15 to 17 if and when the Home Secretary makes an order to that effect. A child convicted of homicide or a young person convicted of any offence for which if an adult he could be sent to prison may be placed under a care or supervision order or his parent or guardian may be ordered to enter into a recognisance (see above).

If a police inspector or higher officer swears before a J.P. that a young person is suspected of an offence which in the case of an adult is punishable with imprisonment and the issue of prosecution has to be decided the J.P. may issue a summons for his attendance or a warrant for his arrest for the purpose of bringing him before a Court which may order his finger and palm prints to be taken. Existing provisions for subsequent destruction of such prints in certain circumstances in the case of an adult apply also to such young persons.

It is the duty of the local authority concerned to supply the Court with information as to home surroundings school record health and character to assist the Court in its decision. Existing restrictions on newspaper reports of Court proceedings against a child or young person (which might identify him) are extended to young persons of any age below 18 and to appeals unless the Court decides to waive the restrictions to avoid injustice to the child or young person accused.

A supervision order is an order for supervision by a local authority or probation officer and may

include a requirement that the child or young person shall (i) reside with a named individual who agrees to take charge of him or (ii) live for a specified period in a specified place and to present himself to a specified person at specified times and places and to participate in activities on specified days. But the total periods under (ii) shall not exceed 90 days in all.

Further if the Court is satisfied on medical evidence that the mental condition of the child or young person is susceptible to medical treatment (e.g. in drug offences)—though without the need for detention—the Court may order him to submit to treatment by a qualified medical practitioner or as a non resident patient in a specified place or as a resident patient in a hospital or nursing home but if he has attained 14 years of age not unless he consents. No such requirement shall continue in force after the age of 18. Any supervisor's duty is to advise assist and be friend. The Court may vary or discharge such orders from time to time. If the child or young person is over 13 and the Court orders that he has failed to comply with any condition imposed it may fine him up to £20 if it discharges the order it may impose any punishment which it could have imposed if it had had power to try him for the offence leading to the supervision order. If and when a doctor certifies that the treatment should be extended or varied or is not effective or no longer necessary the doctor shall so report to the supervisor. He shall notify the Court which may cancel or vary the requirement. In most of such cases the supervised person must be brought before the Court. If he does not attend on summons he may be arrested on warrant and while awaiting the hearing detained for not more than 72 hours. A supervision order shall cease to have effect at the end of 3 years or the attaining by the supervised person of the age of 18 unless previously discharged.

Part I of the Act also contains detailed requirements for the appointments by the children's region planning committee of supervisors and arrangements for supervision for committed to the local authority's care. The local authority's powers and duties (similar to those possessed by a parent or guardian) including arrangements for visits by an independent person to advise and be friend him. The Act also lays down details for release as well as for detention in emergency cases detention without warrant or sentence must not exceed 8 days which applies equally to a child so arrested otherwise than for homicide. Detention may be in a community home. There are penalties by fine up to £20 for absence from premises where a supervised person has been ordered to remain and for anybody who knowingly compels persuades or assists him to go absent.

Part II of the Act regulating conditions of accommodation in community homes and of those boarded out with foster parents (in both cases regular inspections must be held) was brought into force on 1 December 1969. The provisions are very detailed every local authority must see that foster children are regularly visited and take steps to see to their safety and well being.

Community homes constitute a single legal category of establishment for all children in care replacing (when the Act is fully operational) the existing separate categories of approved schools remand homes and probation hostels. They would be planned by regional committees established by groups of local authorities sometimes in partnership with voluntary organisations.

Many of the provisions detailed above have not yet been brought into force and indeed may be phased into operation so that different ages may be specified for different purposes. It should be noted that the Government has announced that it does not intend to bring into force the section which restricts the right to prosecute a young person (see above) nor does it intend to seek to raise the *minimum age for prosecution* to 12 until satisfied that local authority social work departments can cope with the increased burden and that there is no intention of raising the age above 12.

The reorganisation of Central Government has led to many of the responsibilities in this field being transferred from the Home Office to the Department of Health & Social Security.

A Home Office White Paper of December 1970 stated that the number of children in England and Wales in the care of local authorities on 31 March 1970 was 71 210 of voluntary organisations 12 475 Of the former total 5 411 (though in the care of local authorities) are accommodated in

voluntary homes The corresponding figures for 1969 were 70 188 and 13 434 respectively The slight decrease in the voluntary figure does not imply that these organisations play any less important part than in the past in the pattern of services available to children and their families

JUSTICES OF THE PEACE

Sentencing Policy—The arrangements announced at the end of May 1964 by the Lord Chief Justice for the purpose of achieving greater uniformity of sentencing policy and a deeper understanding of the many social factors involved comprise the organisation of more and longer conferences of all holders of judicial office including justices of the peace chairmen of quarter sessions recorders and High Court judges Working parties in groups consider case histories of offenders and later meet to discuss the sentences which each group would have passed if these cases had come before them in court On the same day it was announced from Downing Street that a Royal Commission was being appointed (under the chairmanship of Lord Amory (former Chancellor of the Exchequer))

to conduct a fundamental review of penal methods the concepts and purposes which should underlie the punishment and treatment of offenders in England and Wales to report how far they are realized by the penalties and methods of treatment available and whether any changes are desirable in these or in the arrangements and responsibility for selecting the sentences to be imposed on particular offenders and to review the work of the services and institutions dealing with offenders and the responsibility for their administrations and to make recommendations

Some of the Commission's recommendations are incorporated in the Criminal Justice Act 1967 (D10 and the Criminal Law Act 1967 (D10-11))

Compulsory Training of New J.P.s—Early in June 1964 the Lord Chancellor announced new arrangements for the compulsory training and instruction of newly appointed justices of the peace and fresh attempts to stop glaring instances of inadequate excessive or inconsistent sentences 'An advisory council has reorganised the present scheme for voluntary training (which started in 1950) and every newly appointed justice gives an undertaking not to try cases without the Lord Chancellor's sanction unless he or she has been through a compulsory course The course includes attending as observers in their own and other courts and at quarter sessions and visits to prisons borstals and similar institutions

General Duties of J.P.s—All these announcements have focused attention upon the work of justices of the peace—the unpaid, lay magistrates throughout the country who deal with the largest proportion of criminal offences in various courts Other manifold duties fall upon them—the appointment of special constables certain matters relating to highways the grant and renewal of licences for the sale of intoxicating liquors domestic proceedings (matrimonial orders between husband and wife) custody of children and affiliation and adoption orders Certain magistrates—both laymen and lawyers—with special qualifications sit in juvenile courts to deal with offences by and against young people and with the committing of young people to the care of approved persons or authorities whenever the young people are in need of care and protection

Although therefore the criminal jurisdiction of J.P.s (as they are generally known) is by no means the full extent of their duties it is this criminal jurisdiction which has been most frequently in the public eye and the three announcements mentioned above relate only to that aspect of the J.P.s duties Neither historically nor currently are J.P.s expected to be lawyers the clerk of the court who advises them on points of law is nearly always a solicitor and at quarter sessions the chairman and deputy chairman are usually barris-

ters or solicitors of not less than ten years standing with special qualifications for the task

Procedure and Powers—For domestic proceedings and in juvenile courts (outside the City of London and the metropolitan stipendiary court area where full time legally qualified paid magistrates preside) not more than three J.P.s should sit including both a man and a woman whenever practicable For other duties not more than seven J.P.s (and preferably not more than five and an odd not even number) should sit The election of a chairman and a number of deputy chairmen is held by the J.P.s in October those elected hold office for one year from January 1 and are eligible for re-election All sittings are held in public except in domestic proceedings custody guardianship and adoption cases and in these and in juvenile courts the press though not usually excluded are not permitted to identify the parties by name or address or to publish evidence of an indecent character

The powers of one single J.P. sitting alone are restricted to adjourning a trial remanding a prisoner in custody or on bail and taking recognisances An information charging an offence may be laid before him if it is in writing and substantiated on oath he may issue a warrant in a civil matter in similar circumstances he may issue a summons Search warrants may in most cases be issued by a single J.P. and so may a summons or warrant requiring the attendance of a witness A stipendiary (legally qualified paid full time magistrate) is not so limited he has all the powers of a court of summary jurisdiction (i.e. two or more J.P.s sitting together)

Criminal Jurisdiction—Except in those instances in which a special limit of time is prescribed by a particular Act of Parliament no information may be laid (in regard to a criminal offence) nor complaint (in a civil case) after the lapse of six months from the date when the offence was committed or the matter of complaint arose The J.P.s criminal jurisdiction covers (1) the trial of summary offences (minor offences triable by a magistrates court other than under (2) below) punishable by a maximum of six months imprisonment for one offence, or a fine (in general) not exceeding £100 The jurisdiction also extends to (2) certain 'indictable (or arrestable) offences which may be tried summarily if the accused consents In such cases the maximum punishments are 6 months imprisonment or a fine not exceeding £400 or both for one such offence or 12 months imprisonment for two or more such offences There are also (3) certain petty offences which the accused or the prosecution may elect to be tried on indictment before a jury at quarter sessions No offender under the age of 17 may be sentenced to imprisonment by a court of summary jurisdiction but such young offender may be sent to a detention centre Alternatively he may be committed in custody to quarter sessions for sentence to a period of borstal training First offenders should not be sent to prison they are frequently placed on probation or given suspended sentences D(10/2)

One J.P. or more may sit as a court of preliminary enquiry to determine whether there is a *prima facie* case (i.e. one that calls for a defence) against an accused which will require his being indicted before a jury For this purpose the J.P.s take depositions (that is evidence given (see D10/2) under oath by prosecution witnesses and reduced to writing and signed by each witness who has given it) If the J.P.s decide, at the end of the hearing that the prosecution has disclosed no *prima facie* case the accused is discharged If there is such a case, then after due warning to the accused that he is not obliged to say anything but

that if he does answer the charge anything he says will be written down and may be used in evidence at his trial. He is committed for trial on bail or in custody (according to the gravity of the charge) at quarter sessions or assizes. (For restrictions on newspaper reports of such proceedings see Criminal Justice Act 1967 (D10(2)))

History of the Office of J.P.—The above is by no means an exhaustive account of the duties of J.P.s and of the procedure before them but sufficient has been said to indicate the vital importance of their work. The office is both honorary and honourable as early as 1227 in the reign of Edward I the King appointed conservators of the peace within his Kingdom and the Justices of the Peace Act 1361 in the same reign determined what sort of persons should be Justices of the Peace and what authority they should have. From that day to this their duties have gradually become more difficult and extensive as society has grown more complex. It would seem that while there are many advantages in leaving the trial of the less grave offences to lay magistrates (as J.P.s are) the system which for over six centuries has prominently figured in our penal practice will be brought up to date and made more efficient by the proposed compulsory training. The only doubts have arisen on the ground that persons of the best of reputation in the counties (Act of 1844) who are prepared

to give their time without remuneration to these public spirited duties may find it difficult or in some cases impossible to attend courses of training in their spare time in addition.

Recruitment of J.P.s—The Lord Chancellor in his 1965 presidential address to the Magistrates' Association at Guildhall London said he would like to see the J.P.s recruited from more varied walks of life. The strength of the lay magistracy he said is dependent on the ordinary man and woman realising that the Bench reflects all shades of opinion and are not representative of one section only. He said he would also like to see more coloured magistrates appointed.

There are now two coloured justices serving on the Bench and these appointments have both been tremendously successful. The Lord Chief Justice in October 1970 said that J.P.s should be empowered to give up to 12 months prison sentences for violent crimes. He advocated reconsideration of compulsorily suspended sentences during which many people commit further offences. See also D10(2).

Justices of the Peace Act 1968 By this Act *ex officio* J.P.s are abolished except for the Lord Mayor and aldermen of the City of London who may still sit together with lay justices appointed by the Lord Chancellor.

FREE SPEECH AND PUBLIC ORDER

In the constitution of our parliamentary democracy (see D8) certain unwritten rules have been recognised for about three centuries past. These rules which are not always easy to reconcile may be summarised as follows.

(1) **Free Speech**—Free and open discussion within the law ought to be permitted both in private and in public of all political social moral and religious questions.

(2) **Unpopular Opinions**—Unpopular or minority opinions lawfully expressed privately or publicly by act or word do not become unlawful merely because their expression may induce other people to commit unlawful acts.

(3) **Provocation**—Every man is presumed to intend the natural consequences of his acts hence the use of threatening abusive or insulting language or behaviour if it is naturally provocative of disorder is unlawful.

(4) **Public Order**—The preservation of public order is of paramount importance. A magistrate or police officer or any person (see D11(1)) has a right and duty to take any steps necessary to stop a breach of the peace taking place or to prevent a breach which he reasonably apprehends.

These rules have recently been widely discussed as a result of the activities of political extremists who make a special feature of propaganda against racial or religious minorities. Some of their meetings and marches have been accompanied by grave public disorder.

Until comparatively recent times the whole subject depended upon common law decisions (D7) not statute law (D8). For example

Unlawful Assembly is a common law offence constituted by an assembly of three or more persons intending either to commit a crime by open force or to carry out any common purpose whether lawful or unlawful in such manner as to give firm and courageous persons in the neighbourhood reasonable grounds to apprehend a breach of the peace in consequence of the assembly. (The words *any common purpose whether lawful or unlawful* should be noted.)

Sedition is a common law crime which includes the doing of acts or the speaking of words with the intention of promoting feelings of ill will or hostility between different classes of the Queen's subjects. If the words or acts (whatever the intention) have a direct tendency to cause unlawful meetings or disturbances they are seditious since

a man is presumed to intend the natural consequences of his acts (see (3) above). This does not mean that there must be no full and free discussion nor that there is any prohibition upon criticism or even censure but there must be no malignity nor any imputation of corrupt or malicious motives such as to incite people to take the law into their own hands and to provoke them to tumult and disorder.

With these principles in mind let us consider some actual cases (decided during the past ninety years) in which these rules have been applied.

Beatty v Gillbanks (1882) arose from the activities of the newly founded Salvation Army which was an association for carrying out religious exercises among themselves and for a religious revival among certain classes of the community. Its leaders formed their followers into processions which marched through the streets of Weston super Mare with bands and banners collecting people as they marched back to their hall where prayer meetings were held. They were opposed on several occasions by an organisation calling itself the Skeleton Army which objected to these religious exercises. In consequence disorders frequently arose and the Salvation Army leaders were charged with unlawfully and tumultuously assembling to the disturbance of the peace. The Magistrates bound them over to be of good behaviour the Salvation Army appealed to the High Court.

The Judges decided that the Magistrates were wrong. Everyone must be taken to intend the natural consequences of his acts ((3) above) and if this disturbance of the peace was the natural consequence of the Salvation Army's activities they would have been liable and the Magistrates would have been right to bind them over. But the evidence does not support this contention. There was nothing in their conduct which was either tumultuous or against the peace on the contrary the evidence shows the disturbances were caused by other people antagonistic to them. What has happened here is that an unlawful organisation has assumed to itself the right to prevent the Salvation Army from lawfully assembling and the decision of the Magistrates amounts to this—that a man may be convicted for doing a lawful act if he knows that his doing it may cause another to do an unlawful act. There is no authority for such a proposition.

Wise v Dunning (1902) is a contrasting case. A fanatical Protestant clergyman had on several occasions held meetings in parts of Liverpool

continuing a strong Roman Catholic population. At these meetings he had used offensive violent and provocative language attacking the Pope and the Roman Catholic Church. In consequence breaches of the peace had occurred and the Liverpool Magistrate had bound him over to be of good behaviour. The Protestant clergyman appealed to the High Court protesting that there was no evidence that he had committed or intended to commit a breach of the peace and that the Magistrate's decision (as in the earlier case) was wrong. But the Judges upheld the Magistrate's decision and dismissed the appeal. The Lord Chief Justice said: "there was abundant evidence that in the public streets he had used language which was abusive which had caused an obstruction and that he intended to do similar acts in another place. The two other Judges said that every case depends upon its own facts and evidence."

The law does not as a rule regard an illegal act as being the natural consequence of a temptation held out to commit it, but the cases show that the law regards the infirmity of human temper to the extent of considering that a breach of the peace although an illegal act may be the natural consequence of insulting or abusive language or conduct.

The clergyman's behaviour (unlike that of the Salvation Army leaders in the earlier case) was in itself violently provocative, therefore the Magistrate was justified in binding him over under preventive power to stop breaches of the peace which were the natural result of his behaviour.

Both the above cases as it happened dealt with religious controversies. But the same rules apply in controversies of other kinds.

Duncan v Jones (1936) was concerned with provocation on a political and social question. There was grave unemployment at the time and feelings between the unemployed and their supporters against the Government and its policies ran high. Mrs Jones had held a meeting of unemployed men right opposite an unemployment training centre, she had made a speech strongly attacking the Government's policy and a disturbance had followed. Fourteen months later when she appeared at the same place for the same purpose the Police Superintendent forbade her to hold the meeting there. She insisted on doing so, stepped on her box and began to address the bystanders. It was not at that stage suggested that she was obstructing the highway or meeting anybody to commit a breach of the peace. Nevertheless she was convicted of obstructing the Superintendent in the execution of his duty and her conviction was upheld by the High Court. She must have known (from earlier experience) the natural consequence of holding such a meeting at that place. The Superintendent reasonably apprehended a breach of the peace. It therefore became his duty to prevent it and she was guilty of obstructing him in carrying out that duty.

The Public Order Act 1936—In the period preceding the Second World War extremist political organisations held meetings at which they wore political uniforms and used strong-arm tactics similar to those in vogue among the Italian Fascists and German Nazis. They also indulged like the Nazis in virulent propaganda calculated to stir up racial hatred. As a result of the explosion of public feelings in the existing state of international tension, grave disorders took place in London and other cities. The situation was discussed in both Houses of Parliament and it was generally agreed that the law required to be clarified and strengthened. On December 18, 1936 the Public Order Act received the Royal Assent and came into force on January 1, 1937.

Prohibition of Political Uniforms.—Section 1 of the Act (subject to certain exceptions) forbids the wearing in a public place or at a public meeting of uniform signifying the wearer's association with a political organisation or with the promotion of a political object. (The exceptions are ceremonial anniversary or other special occasions on which the Chief Officer of Police may permit

a relaxation of the prohibition (with the Home Secretary's consent) only if he is satisfied that at no risk of public disorder is likely to be involved.)

Prohibition of Quasi-Military Organisations.—Section 2 makes it an offence to participate in the control or management of an association whose members are (a) organised or trained or equipped to enable them to be employed in usurping the functions of the police or of the armed forces of the Crown or (b) organised and trained or organised and equipped as follows: either (i) for the purpose of the use or display of physical force in promoting a political object or (ii) in such manner as to arouse reasonable apprehension that they are organised and either trained or equipped for the purpose described in (i). (It was under (b) (ii) that two of the leaders of a present day extremist political organisation were convicted and sentenced to imprisonment in October 1962 at the Central Criminal Court; their appeals were dismissed.) The consent of the Attorney General (the Senior Law Officer of the Crown) is required before a prosecution under Section 2 can be instituted. In certain circumstances a High Court Order may be made to search the premises of the organisation and to impound its property.

Preservation of Public Order on the Occasion of Processions.—Section 3 confers powers for this purpose as follows:

(1) On a Chief Officer of Police if he has reasonable grounds for apprehending that a procession may occasion serious public disorder (having regard to time, place and circumstances) power to impose on the organisers or participants in the procession such conditions as appear necessary for preserving public order (including the route of the procession and power to prohibit it from entering any public place) but no conditions restricting the display of flags, banners or emblems are to be imposed unless they are reasonably necessary to prevent risk of a breach of the peace.

(2) On a Borough or Urban District Council if the Chief Officer of Police believes that his powers under (1) (above) will not suffice to prevent serious public disorder and on application by him) power to make an Order (with the consent of the Home Secretary) prohibiting all public processions or certain classes of public processions in the area for a period not exceeding three months. (This power does not apply within the City of London or the Metropolitan Police Area, as to which see (3) (below).)

(3) On the Commissioner of the City of London Police and the Commissioner of Metropolitan Police a power similar to that described in (2) (above) and on similar conditions. Thus within the London Area the Police Authorities and in urban areas outside London the Local Authorities are given power to prohibit processions (or marches) on the conditions described in (2) above.

It is an offence for anybody knowingly to fail to comply with any Order or condition imposed or to organise or assist in organising a public procession in contravention of the Section.

Prohibition of Offensive Weapons.—By Section 4 anybody is guilty of an offence if he has with him any offensive weapon at a public meeting or on the occasion of a public procession without lawful authority. (Note the words "on the occasion of a public procession" it is not only those taking part in the procession but also bystanders who may commit this offence.) Lawful authority extends to servants of the Crown, Members of Parliament or of a Local Authority (acting as such), police officers, members of Fire Brigades or Cadet Corps and so forth.

Prohibition of Offensive Conduct Conducive to Breaches of the Peace.—Section 5 (as now amended by the Race Relations Act 1965) reads:—Any person who in any public place or at any public meeting (a) uses threatening, abusive or insulting words or behaviour or (b) distributes or displays any writing, sign or visible representation which is threatening, abusive or insulting with intent to

provoke a breach of the peace or whereby a breach of the peace is likely to be occasioned shall be guilty of an offence

Disorderly Conduct at a Public Meeting—Section 6 refers to the Public Meeting Act 1908. Section 1 of the 1908 Act makes it an offence for a person to *act in a disorderly manner at a lawful public meeting for the purpose of preventing the free action of the meeting's business*. Section 6 of the 1936 Act gives power to a constable if he reasonably suspects an offence under the 1908 Act to demand of the suspected offender his name and address (provided that the chairman of the meeting requests him to do so). If the suspected offender refuses or fails to give his name and address or gives a false name and address he commits an offence and the constable may arrest him without warrant. (Note that to qualify for protection the public meeting must in the first place be *lawful*.) Section 6 of the 1936 Act has been considerably extended and strengthened by Section 6 of the Race Relations Act 1965 for stirring up hatred on grounds of race or colour. The Public Order Act 1963 has greatly increased the penalties under Section 5 of the Act of 1936 and Section 1 of the Act of 1908. But an undertaking has been given by the Home Office that the new Act will not be used to suppress mere heckling at a public meeting. See also Race Relations Act 1968 below.

Jordan v Burgoyne (1963) was similar to *Wise v Dunning* (1902) except that the 1963 case was concerned with section 5 of the Public Order Act 1936. At a public meeting in Trafalgar Square to an audience of 6,000 which included many Jews Colin Jordan used the words—'Hitler was right. Our real enemies—the people we should have

fought—were not the National Socialists of Germany but World Jewry and its associates. There was complete disorder and a general surge towards the speaker by the crowd, but they were restrained by the police under Superintendent Burgoyne and 20 arrests were made while the crowd was being dispersed.

Before the Bow Street Magistrate Jordan was convicted and sentenced to imprisonment for using at a public meeting insulting words whereby a breach of the peace was likely to be occasioned. He appealed to Quarter Sessions who found as a fact that though the words were highly insulting they were not likely to lead ordinary responsible persons to commit breaches or the peace; they therefore allowed Jordan's appeal against conviction. The prosecution then asked for a case to be stated for the High Court on the question whether the words in section 5 could properly be interpreted to mean likely to lead to a breach of the peace by ordinary citizens.

The Lord Chief Justice with two other Judges decided that Quarter Sessions were wrong. The test was not whether the insulting words were likely to cause a breach of the peace by a *hypothetical audience* whatever their creed, faith, race or political views, in any case the Judges imagined that any reasonable citizen would be provoked beyond endurance. But this was an Act to keep order in public places and a speaker must take his audience as he finds it. If those words to that audience are likely to provoke a breach of the peace the speaker is guilty of an offence. The right of free speech is not in question; he may express his views as strongly as he likes, but he must not threaten abuse or insult that audience. The case was sent back to Quarter Sessions with a direction to find the offence proved and to dismiss Jordan's appeal from the Magistrate's conviction. See D6.

RACE RELATIONS

It is already a criminal offence under the Race Relations Act 1965 to stir up hatred on grounds of race or colour. The Race Relations Act of 1965 is not penal in its remedies but makes discrimination a civil wrong giving rise (in the first place) to conciliation (see below) by regional committees and (if these fail) to damages (D16(1)) or injunction (D15(2)) or both. A person who feels there has been discrimination against him can complain in writing or by word of mouth or someone else authorised by him in writing can complain on his behalf within two months of the discriminatory act to the local conciliation committee or to the Race Relations Board direct. The Act applies to discrimination on grounds of race, colour or ethnic or national origins. Unlawful discrimination means treating a person less favourably than others on any of the above grounds, separate but equal treatment (e.g. segregation) counts as less favourable treatment.

It is unlawful for anyone providing the public with goods, facilities or services to discriminate by refusing or deliberately omitting to provide any body with goods etc. of the like quality in the like manner or on the like terms as are normally made available to others. Examples are—access to and use of any place which the public may enter; facilities for entertainment, a recreation or refreshment; accommodation in a hotel; boarding house etc.; facilities for banking, insurance, grants, loans, credit or finance for education, instruction or training or the services of any trade, profession, business, local or other authority. But hotels etc. are exempted if the landlord or some of his immediate family live on the premises or where there is not normally accommodation for more than twelve persons in the first two years of the Act or six persons thereafter besides the landlord and some of his family.

It is also unlawful to discriminate in employment—terms, recruitment, training, promotion, dismissal, or conditions of work—also to refuse to employ a person on grounds of race etc. on work of any description which is available and for which he is qualified (though employers may treat employees differently by reason of seniority, ability, or educational standards). During the second two years of the Act, commencing 14 November 1970, employers of less than ten

employees are exempted for the following two years the limit will be abolished. And if an employer discriminates in good faith for the purpose of preserving a reasonable balance of different groups the discrimination is not unlawful but reasonable balance must be between (1) those who (of whatever race, colour etc.) were born or wholly or partly educated in Britain and (2) others whatever their race etc. Other exemptions are *inside* employees in a private household (e.g. au pair girls) but not *outside* employees (e.g. builders) employment wholly or mainly outside Britain in any country ship or aircraft, in a British ship if persons of different races etc. would otherwise have to share sleeping mess or sanitary accommodation or where race etc. is a *bona fide* qualification (e.g. waiters in a Chinese restaurant).

It is unlawful for any organisation of employers or workers to discriminate in admitting members, benefits of membership or expulsion, in selling or letting all types of premises (including furnished or unfurnished living accommodation, business premises or land). The prohibition applies equally to property owners (including companies), estate agents, developers and local authorities (e.g. borough councils)—unless (1) the person offering accommodation (the landlord) lives in the premises and shares facilities with others and (2) there is accommodation for not more than two households besides the landlord or (3) the landlord wholly occupying the premises sells without any advertisement or estate agent. It is also unlawful to publish or display any discriminatory advertisements or notices. Until 13 November 1970 boarding and lodging houses were included in (1) and (2) if there was not accommodation for more than 12 persons other than the landlord's household. From 14 November 1970 the number was reduced to six.

Anybody who deliberately aids, induces or incites another unlawfully to discriminate will be equally liable—e.g. neighbours who put pressure on a vendor to prevent sale of his house to a coloured etc. person. (But incitement to racial hatred is still a crime (D45(1)).)

If a regional committee of the Race Relations Board thinks on investigation of a complaint there has been unlawful discrimination, it will try

by private conciliation to settle the complaint and to get the discriminator to give a satisfactory written assurance for the future. Only if such assurance is refused will court proceedings arise. The Board will proceed in one of the special county courts (D5) where the judge will be assisted by two assessors. The court may grant an injunction to restrain future unlawful discrimination or damages for actual or potential loss suffered by the victim or both. Disobedience will mean a

penalty for contempt of court. Employment complaints are an exception. They will be first referred to the Department of Employment and Productivity which will try to settle by conciliation if there is suitable machinery. If the complainant is dissatisfied he can appeal to the Board which can then apply for injunction or damages for actual loss and loss of opportunity (compensation for lost benefit which the complainant might have expected).

ADDITIONAL DETAILS ON CRIMINAL LAW (PUNISHMENT)

(See D10)

OVERCROWDING IN PRISONS—POSSIBLE REMEDIES

It has long been recognised that the country's prisons many of which were built more than a century ago are extremely congested partly because of the increase in convictions during the past 20 years (from 20 000 to 40 000) and partly because the present accommodation is not adapted to modern ideas of reformative treatment (D10(1)). In November 1970 the Home Office Parliamentary Under Secretary outlined a double approach to the problem. First the prison building and modernisation programme is to be pressed on as fast as possible. Secondly the Government is looking into new alternative forms of punishment and treatment. This however requires the understanding and approval of public opinion. The Home Office must stress that it does not safeguard the general community to herd men into old fashioned prisons sleeping two or three in a one man cell which prevents the use of reformative methods and makes prisons places that train men for further crime rather than try to reform them to live in the general community.

This second plan—to find suitable alternative methods of treatment—will necessitate increasing the probation and after care service from its strength of 3 400 (November 1970) to 4 700 officers by 1975. The cost of training them and of paying them adequate salaries will be provided by the Government. If however the present trend of crime increase continues convicted men will be hardened and more difficult for probation officers to deal with. However three working groups of consultants are considering how the proposed enlarged services can best be used.

The prison population can be divided roughly into two—(1) those whose offences and conduct show clearly the need for secure detention (see D10(4))—Prevention) (2) those who could be dealt with adequately in ways which do not segregate them from their families and general society who may be reformed by help and guidance (D10(1))—Reformation) and thus avoid drifting into recidivism → e continual repetition of crime.

Division (2) may be treated in three possible ways

(a) A scheme of part time community service by offenders to be run by probation officers and voluntary (charitable) agencies. This would be purposeful which prison life is not. Offenders would be encouraged under supervision to make some repayment to the general community for the injury and damage they have done (see also D11(1))—Compensation. If this succeeded it would avoid the enormous problems of adjustment to civilian life for prisoners who intend to go straight at the end of their sentence. But

many practical problems are involved and are being investigated.

(b) A scheme combining a fine with a compulsory term of probation. It is recognised that this has the disadvantage of changing the present basis of the relationship between the probation officer and the offender which is very important. But there is bound in any case to be an element of compulsion in practice if supervision by probation officers is to play its part in a new system of substitutes for prison. Investigation has started.

(c) A scheme of intermediate treatment—compulsory attendance at day or evening centres or in hostels where offenders can receive constant guidance and support. In 1970 the Home Office began an experiment to extend the scope of approved probation hostels (previously provided only for treatment of juveniles in need of care—D41) to men up to 30 or even 35 years of age. The Courts are already using these new facilities for some men with criminal records who would otherwise have been sent to prison. Voluntarily run hostels for after care are already in use. A similar system should be tried to keep men out of prison. Investigation proceeds.

Further suggestions being considered are (i) extending the temporary release of prisoners on parole and (ii) relaxing the censorship of letters at open prisons. This latter is already partially in force at one open prison. And (iii) the home leave scheme which now applies towards the end of a sentence for certain prisoners serving five years or more may be extended to some serving three years or more.

Since this pronouncement the tragic fact has emerged that among the greatly increased total prison population (see above) there were about 18 600 mentally disturbed persons in 1969 compared with 6 000 in 1961. For these men prison is totally unsuitable: they need long term medical or psychiatric treatment but only three hostels are at present (November 1970) suitable holding only about 150 patients. Part of the difficulty is that prisons are the responsibility of the Home Office mental hostels or hospitals of the Department of Health: there is now no legal power to confine such mentally disturbed persons in mental hospitals if they do not choose to stay. If they abscond and commit further offences they can be sent only to prison and from there to mental hospitals again. To prevent this process from being constantly repeated the law should be changed so that such unfortunates may be securely held in mental hostels or hospitals during their treatment. (This is quite apart from places like Broadmoor where persons found not guilty by reason of insanity (D10(1)) of murder are confined during the Queen's Pleasure—see until (if ever) they are no longer dangerous.)

ADDITIONAL DETAILS ON LAW OF LANDLORD AND TENANT

(See D26(1))

THE HOUSING ACT 1969 AND A BRIEF FORECAST OF EXPECTED REFORM

The object of the very lengthy 1969 Act was to increase the availability of housing accommodation at reasonable and fair rents. It was argued that before the Act landlords of dwellings controlled by the old Rent Restrictions Acts—a

control perpetuated by the Acts of 1965–1968 for premises of very low rateable value (D25(2)) were unwilling either to let them because of the poor return, or to put or keep them in a good state of repair with proper amenities of a modern kind.

Accordingly Parts I and II of the 1969 Act allow local authorities (referred to below as 'councils') to provide financial assistance for

landlords of such dwellings whether houses or flats towards the cost of conversions and improvements and coin the term 'improvement areas' which the councils may declare some districts to be and advertise the facilities available.

Parts III and IV deal with rents of improved accommodation in dwellings occupied by one or more families further details of these Parts are given below.

Part V is concerned with slum clearance—a problem tackled (never quite successfully) by many governments in the past.

Part VI gives councils power to *insist* on repair of old fashioned houses without proper amenities to make advances for such repairs and (if necessary) to make improvements by agreement with and at the expense of the owner. It is estimated that when the Act came into force 1.8 million dwellings were unfit for habitation a further 4.5 million lacked standard amenities (see below) or were in need of repairs costing at least £125 each. Councils are also required periodically to review housing conditions in their areas.

The size of the problem is due to many causes—not only the freezing of *controlled rents* at very low levels but also the earlier age at which young people leave home to found their own families the inability of the few who still occupy big old fashioned houses to procure domestic help to enable them to keep such a house going as a single unit with the result that some rooms are disused or let off as apartments in a dilapidated and unsuitable state.

In the brief account of Parts III and IV below the separate units into which a larger house or flat may be divided are called *dwellings*. The entire Act has 91 sections and ten schedules all therefore that can be done here is to give a short summary of some of its important provisions as they affect landlords and tenants.

The Department of the Environment (formerly the Ministry of Housing & Local Government) has issued two booklets for the guidance of landlords tenants and lodgers (the terms used where more than one family occupies a single unit)—(1) *House Improvements & Rents* and (2) *Phasing of Rent Increases*. These booklets contain simple questions and answers to some of the problems arising under the Act. But they are *not official statements of law* the complications of which will necessitate consultation with a solicitor if a dispute arises.

Part III has as its main purpose the increase of rented accommodation by offering landlords incentives by way of higher rents to improve those dwellings still controlled by the Rent Restrictions Acts (D25(2)) by installing certain standard amenities (see below) which may enable them to be converted into regulated tenancies under the Rent Act 1968 at fair rents higher than the old controlled rents (D25(2)). Such conversion may take place when the landlord has satisfied the qualifying conditions—*i.e.* that the dwelling (a) is provided with all *standard amenities* for the exclusive use of its occupants (b) is in good repair (disregarding internal decoration) having regard to its age character and locality (c) is in all other respects fit for human habitation. If satisfied on these points the council may on the landlord's application issue a qualification certificate to that effect whereupon (in most cases) a tenancy becomes a regulated tenancy to which the 'fair rent' provisions apply.

Standard amenities are a fixed bath or shower wash hand basin and sink with hot and cold water supplies to all water closets indoors (or readily accessible from the dwelling). Bath or shower should be in a bathroom. If this is not practicable they may be in any room except a bedroom. The qualification certificate shall not be issued unless—(a) the dwelling has at all times since 25 August 1969 been provided with standard amenities or (ii) works to provide them were begun before that date (iii) the landlord except with the council's written consent uses each dwelling for the purposes of private occupation (not business) must not be charging a rent higher than the legal rent and no premium may be paid or asked by him or any tenant (There are some other conditions for which reference must be made to the Act.) The application must state the name of the tenant under the existing con-

trolled tenancy what works are necessary to satisfy the conditions with plans and specifications. The council must serve on the tenant a notice (1) that he may within 28 days complain that the dwelling does not satisfy the conditions and (2) explaining the effect of the Act. If the tenant makes no complaint and the council finds that the qualifying conditions are met it will issue a certificate if the tenant makes such a complaint and the council finds it justified it must refuse the landlord a certificate in either case it must notify the tenant of the result.

If (under (ii) above) the application was made before the works were completed but the council thinks the dwelling will satisfy the qualifying conditions after completion it may *provisionally approve* the applicant's request and issue a certificate accordingly sending a copy to the tenant whose consent must be obtained both before and after the works are completed. In such cases in order to obtain a *fair rent certificate* the landlord must apply to the rent officer (D25(2)) with copies of plans and specifications the officer's certificate specifies the fair rent which may be charged under a regulated tenancy if the works are properly completed. When the council has issued the fair rent certificate and is satisfied that the dwelling meets the qualifying conditions it shall issue a qualification certificate and send the tenant a copy. After such conversion from a controlled to a regulated tenancy the landlord applies to the rent officer for registration of the fair rent. If the council refuses a certificate or provisional approval it must give the landlord its written reasons.

A landlord who has been refused or a tenant who thinks the council's certificate was wrongly issued may appeal to the County Court which after inspection and consideration may refuse or allow the appeal with or without conditions. If the council's certificate is quashed (*i.e.* cancelled) any fair rent registration shall be deleted and shall be regarded as never having been effective.

Where the council gave only provisional approval—(ii) above—the tenancy shall remain controlled until the full certificate is issued. In certain circumstances some rent increases permitted by the 1968 Act (D25(2)) may be disallowed if the above procedure has not been followed or may be recovered only in stages as laid down in the Act. The tenant's consent must be sought for the works to be carried out. If it is refused the County Court may consider the dispute (giving regard particularly to the tenant's accommodation while the works are being done) and make an order with or without conditions according to the facts. It shall make no order empowering the landlord to enter and do the works if the rating authority certifies that the tenant's income is within the rate relief limits specified in the Act.

Part IV of the Act relates to houses in multiple occupation—*i.e.* dwellings occupied by persons who do not form one single household (the former definition was occupied by members of more than one family.) This Part of the Act enables councils to make orders applying a management code for such dwellings to ensure that there are proper means of escape from fire gives directions to reduce or prevent overcrowding in houses in multiple occupation the keeping of registers thereof by the council its powers to make control orders followed by compulsory purchase orders and a list of offences and penalties. For further detail the Act must be consulted.

In November 1970 the new Minister announced plans to speed up the system of housing grants (under Part I). At the same time he promised revised schemes to remedy the housing problem in the worst areas by removing inequalities between tenants of council and private dwellings extending the fair rent principle to both to operate a *rent rebate* system for needy tenants of both classes to take energetic steps for slum clearance by assisting councils and private landlords to improve or rebuild. Further statements of the Government's intentions will be issued after discussion with councils but it will probably be 1972 or later before the further legislation which will be needed can be passed. Thus the 1968 Act is likely to be considerably amended in due course.

THE WORLD OF MUSIC

The art of music as it has developed in the Western world, with a glossary of musical terms and an index to composers

THE WORLD OF MUSIC

In writing this section no special knowledge on the part of the reader is assumed—it is for those who want to know about the history of music how different styles evolved and how one composer influenced another. It is a background to music as the science section is a background to science and just as the latter cannot show the reader the colours of the spectrum but only tell of Newton's experiments and of the relationship between colour and wavelength so in this section we can only describe man's achievements in the world of sound. But knowing something about a composer, his work and when he lived can help to bring fuller understanding and enjoyment when listening to his music.

The section is in three parts

- I Historical Narrative and Discussion
- II Glossary of Musical Terms
- III Index to Composers

I HISTORICAL NARRATIVE AND DISCUSSION

The history of music like that of any people or art is not one of uninterrupted progress towards some ideal perfection. For five centuries or more music in the West has achieved peaks of accomplishment in one style or another before society has dictated or composers have felt the need for something new and different. Thus Wagner's music drama *Parsifal* lasting five hours is not necessarily a more rewarding work than what Monteverdi achieved in *Orfeo* 250 years earlier. More complex yes more rewarding—well that is for the listener to judge.

We must keep this in mind when considering the development of music from a starting point of say Gregorian chant down to the complicated structures of a Schoenberg in our own day. In this development there is no true dividing line between one period and another nor must simplifying terms such as classical or romantic be taken too literally.

The earliest history of Western music as we know it today is closely bound up with the Church for music had to be provided for services. The earliest Christian music was influenced by Greek songs few of which unfortunately have survived and by the music of synagogues where the art of chanting originated. The modal system of the ancient Greeks was highly organised. The earliest Greek scale was from A to A and the four descending notes A G F E became the basis of their musical theory and it is from them that Western music learned to call notes after the letters of the alphabet. A scale can begin on any note and always includes two semitones upon which much of the character of a melody depends.

The Greek modes were based on the white notes only the Dorian Phrygian Lydian and Mixolydian began respectively on E D C and B. Their character was thus decided by the position of the semitones and they formed the basis often corrupted of the mediaeval modes. This system was transmitted through Latin writers such as Boethius and Cassiodorus and through Arabic writers. The eight Church modes were not established until the 8th or 9th cent. These plagal modes as they are called started in each case for technical reasons a fourth below the authentic modes.

By the end of the 6th cent. Gregorian chant had developed so far that some sort of permanent record was required. Neumes signs placed over the Latin text were the earliest attempt at musical notation. Gradually lines came into use until a four line staff was established probably in the 11th and 12th cent. and with them clef signs although the treble clef as we know it today did not appear until the 13th cent.

And what is this music—plaintive—like? It is an unaccompanied single line of melody which when we have become used to its antique flavour is heard to have a wide range of spiritual and emotional expression not excluding word painting. The texts used came from the Liturgy. These beautiful extended lines of flowing flexible melody can still be heard on Sundays in Roman Catholic cathedrals and churches.

Polyphony is Born

The 10th cent. saw the appearance of a book called *Musica Enchiridion* (whose authorship is disputed) which introduced theories about unison singing in which the melody is doubled at the fourth or fifth. Organum or diaphony is used to describe this method of writing a term which confusingly could also be used for a kind of singing where melismatic melody was heard over a drone note on the organ. Rules came into fashion defining which intervals were allowed and which parts of the church services could be sung in more than one part. By the time of Guido d'Arezzo (c. 990-1050) a Benedictine monk who helped advance notation contrary motion was permitted as the cadence was approached another technical advance. Gradually the voices became more and more independent and the third so long considered a discord came into use. Pérotin of Notre Dame was the first composer to write for three and four voices and he and his great predecessor Léonin were the great masters of early polyphony. The proximity and spikiness of Pérotin's harmony is almost modern sounding and as with Gregorian chant once we have adjusted ourselves to the sound this music can be a rewarding experience.

Early Secular Music

In mediaeval France towards the end of the 11th cent. there developed what has become known as the age of the troubadours, poet musicians. They were the successors to the *jongleurs* or jugglers and minstrels about whom we know little as practically none of their music has survived. The troubadours hymned the beauty of spring and of ladies. Contemporary with them in Germany were the Minnesingers. Their songs were mostly set in three modes. Adam de la Halle (d. 1287) because so much of his music survives is perhaps the best known of the troubadours. He was a notable composer of *rondeaux* an early form of round of which the English *Sumer is Icomen in* written by a monk of Reading c. 1220 is a fine example.

Ars Nova

The term *ars nova* derives partly from writings of Philippe de Vitry (1291-1361) who codified the rules of the old and the new music in a valuable treatise. This *new art* represented a freeing of music from organum and rhythmic modes and an increase in the shape and form of melodic line. France was the centre of music during the 14th cent. and apart from Philippe de Vitry the leading composer was Guillaume de Machaut (1300-77) who wrote many secular works as well as a polyphonic setting of the Mass. His music is notable for its vigour and tenderness as well as for its technical expertise. Meanwhile in 14th cent. Italy a quite separate branch of *ars nova* was developing. Imitation and canon were to be noted in the music of Italian composers and choral forms such as the Ballata, Madrigal (which often included instrumental accompaniment) and Caccia (a two voice hunting song in canon) were common. The greatest Italian composer of this period was the blind organist and lutenist Francesco da Landini (c. 1325-97).

England was less affected by *ars nova* and tended to remain loyal to older forms. Not until the 15th cent. did she begin to make a significant contribution to the history of music. Both John Dunstable (c. 1380-1453) who was no less eminent as a mathematician and an astronomer than as a musician and his contemporary Lionel Power advanced the technique of music by their method of composition (use of the triad for instance) and melodious style. Their musicianship was much appreciated on the Continent. Dunstable did away with the use of *cantus firmus*—a fixed melody—and increased the use of free composition.

After Dunstable the next great figure in European music was Guillaume Dufay (c. 1400-74) the most celebrated composer of the Burgundian school. His music is distinguished for its blend of flowing melody cleverly wrought counterpoint and tender expressiveness. Much travelled Dufay was a man of catholic outlook. Together with Dunstable and the Burgundian Gilles Binchois he bridged the gap between 14th cent. *ars nova* and the fully developed polyphony of the 15th cent.

Ars nova composers also showed an interest in secular music and many of their *condesces* and *chansons* (those of Binchois particularly) have been preserved. Personally began to play a distinguishing part in composition.

The results of Dufay's good work can be heard in the flowering of the Franco-Netherland school later in the 15th cent. Its two most notable representatives are Ockeghem (c. 1420-95) and his pupil Josquin des Prés (c. 1450-1521) who carried musical expressiveness even further than Dufay; their work can also be grand and majestic. Indeed Josquin's wide range from the humorous to the dignified partially accounts for his justly deserved high reputation. He was a master of counterpoint but tempered his mechanical ingenuity with imaginative insight.

Throughout the Renaissance choral music was breaking away as we have seen, from its earlier bonds. The mediaeval tradition of having the *cantus firmus* in the tenor went by the board; the use of dissonance when only two voices were used in mediaeval times was abandoned in favour of euphony and all the voices democratically came to share the musical lines. Composers also began to respect their texts where words were previously fitted to the music the reverse was now the case. In Josquin's music, indeed, we have the first attempts at symbolism matching verbal ideas with musical ones. The importance of this musical renaissance has been realised only over the past twenty years. At last the Renaissance composers are coming to be seen not merely as historical figures relevant only in so far as their work culminated in the great classical composers but as masters in their own right whose music should be nearly as familiar to us as is that of a Mozart or a Beethoven.

With the exception of Dufay little is known of the lives of the musicians so far mentioned. Most

of them were in the service of royal or ducal households where they were in charge of the chapel choir or else they worked in or around the cathedrals teaching at choir schools. They were well rewarded for their services and their social position was probably high.

The Sixteenth Century

By the 16th cent. music in England was a steadily expanding art and much encouraged. Music making in the home was becoming quite the fashion in social circles. The Chapels Royal remained the chief musical centres but the music was changing with the development of new secular forms so that it was not so much religious as a part of life. Composers began their lives as choirboys and received a thoroughgoing education both theoretical and practical.

Carrying on from where Josquin and his contemporaries left off Palestrina in Italy, Victoria in Spain, Lassus in the Netherlands and Byrd in England brought the polyphonic style to its zenith. At the same time came the rise of the madrigalists first in Italy then in the Netherlands and then the beginnings of instrumental music as it came to be known in the succeeding centuries.

The vocal composers began to use choral (homophonic) as well as contrapuntal (polyphonic) methods of writing—examples are Victoria's *Ave Verum Corpus* and Palestrina's *Stabat Mater*—but polyphony was still the fullest most magnificent instrument of composition as for instance in Byrd's *O Quam Gloriosum* which shows an eager response to the mood and to the inflection of the words in a kind of vocal orchestra. A feature of all these composers' music but more especially that of Victoria (c. 1535-1611) and Palestrina (1525-94) is its serene simplicity and fervour of utterance. Palestrina was perhaps more spacious in his effects. Victoria the more passionate. How well we can imagine—and sometimes hear—their music resounding down the nave of the great cathedrals of Europe.

The music of Lassus (c. 1532-94) is distinguished both in sheer amount and in vitality. His mastery in the field of motets was unrivalled, encompassing a wide range of subject and mood. He and his fellow Flemish composers Willaert, de Monte and Arcadelt were also expert in the Madrigal, a form popular in Italy and England as well. The Madrigal was a contrapuntal setting of a poem usually not longer than twelve lines in five or six parts. The subject (of the poetry) was usually amorous or pastoral. It was a short-lived but highly prolific vogue. Orlando Gibbons (1584-1633), Thomas Weelkes (c. 1576-1623) and John Wilbye (1574-1638) were the most prominent English exponents.

Instrumental Music

By the end of the 14th cent. instrumental music began to become something more than mere anonymous dance tunes or primitive organ music. Instruments often accompanied voices or even replaced them so that the recorder, lute, viol and spinet indoors and sackbuts and shawms out doors had already been developed by the time instrumental music came to be written down. Gradually a distinction grew up between what was appropriate to the voice and what was suitable for instruments. Byrd, Gibbons and Giles Farnaby in England the great blind keyboard player Cabezon (1510-66) in Spain and Frescoaldi (1583-1643) in Italy produced valuable instrumental works. Perhaps the *Parthena* and the *Psalmbook Virginal Book* collections of Early English Keyboard music give as fair a representative idea as any of the development of instrumental form at this time.

In chamber music musicians often played collections of dance tunes strung together to make a whole or they chose fantasies (or fancies) where a composer altered a tune as he wished. Then there were sets of variations on a ground.

that is a simple tune played over and over again on a bass viol

As far as brass instruments are concerned they were often used on festive occasions in spacious halls or in cathedrals. The Venetian composer Andrea Gabrieli (c. 1510-86) was the first to combine voice and instruments and his son Giovanni Gabrieli (1557-1612) carried the process further to produce sacred symphonies often using antiphonal effects

Drama in Music

Not until the end of the 16th cent. did anyone begin to think about combining drama and music and so invent the new art we know today as opera. A group of artistic intelligentsia met to gather in Florence and conceived the idea of reviving the ancient declamation of Greek tragedy. They took Greek mythological subjects cast them in dramatic form and set them to music not in the choral polyphonic style of the Madrigal but with single voices declaiming dialogue in music. The earliest examples of what was called *Dramma per Musica* were Peri's *Daphne* in 1587 (now lost) and his *Euryclea* in which he co-operated with Caccini. The new style came to its full flowering with the appearance of Monteverdi (1567-1643) whose genius would surely have shone in any age

Monteverdi's first opera *Orfeo* produced in 1607 is a landmark of dramatic expression and it is nothing less than a catastrophe that so many of his later operas have been lost. His *Orfeo* provides the basic ground work for the operas of the next two centuries: recitative accompanied by flute and arpa. His last opera *L'Incoronazione di Poppea* written when he was at the great age (for those days) of 75 succeeds in its aim of creating a free fluid form slipping easily from recitative to arioso and even aria without the strict closed forms that were to be used in the 17th and 18th cent. He focusses attention to an almost unbelievable extent on character rather than situation. He creates real people with all their faults and foibles—the Italianish sexually attractive Poppea, the power drunk infatuated Nero the noble Seneca and the dignified rejected empress Octavia. As recent productions have shown these characters leap from the musical page as if they had just been created, each unerringly delineated in musical terms. Only the vocal line the continuo and the very incomplete instrumental ritornelli parts have been preserved but in sensitive knowledgeable hands tonal variety in the shape of wind and string parts can be added as we know certain instruments were available to the composer

Monteverdi's successors were Cavalli (1602-76) Cesti (1623-69) and Stradella (1642-82) who gave the solo voice more and more prominence encouraged by the advent of the castrato's brilliant voices. These artificially created singers had a vogue and popularity similar to pop singers of today fêted wherever they appeared. The aria became more extended and ornate and dramatic verisimilitude gradually but inexorably took second place to vocal display. An aria was nearly always in *da capo* form the first section being repeated after a contrasting middle one

Sixteenth- and Seventeenth century Church Music

Of course the invention of a new dramatic style affected church music too. The concentration on the vertical aspect of music (homophony) as opposed to the horizontal (polyphony) led to the increasing importance of the voice in religious music. In Italy it is true there was the late flowering great madrigalist Carlo Gesualdo (1560-1614) whose harmonic daring still astonishes us today but by 1600 the cantata was coming to replace older forms in church music. In its simplest form this was a story told in accompanied recitative. Giacomo Carissimi (c. 1604-74) was one of the first significant composers of this new form. He too was in on the birth of the oratorio whose forerunner was the *sacra rappresentazione* (mystery or miracle play) of early 16th cent.

Florence. Then in the mid 16th cent. St. Philip Neri brought in elements from popular plays on sacred subjects in his services in Rome designed to hold the attention of youth—rather as certain persons have tried with pop services today. Emilio di Cavalieri (c. 1550-1662) and Carissimi developed the form adding arias and choral movements omitting actual representation. Alessandro Scarlatti (1660-1725) whose oratorios bear a close resemblance to his operas brought oratorio to its zenith in Italy.

Henrich Schütz (1585-1672) Bach's great predecessor was the founder of German church music. His historical place has never been called into question but only in recent times have the intrinsic merits of his own music come to be recognised. He studied with Giovanni Gabrieli in his youth and later came under the influence of Monteverdi so it was not surprising that he brought Italian ideas across the Alps to Germany and wrote the first German opera *Daphne* now sadly lost. He also introduced his country to the Italian declamatory style and to the new kind of concerto instrumental writing. But his dramatic religious works were his greatest contribution to musical development. He wrote with a devout intensity bringing to life the scriptural texts by closely allying his urgent music to the words. His three settings of the Passions—Matthew, Luke and John—paved the way for Bach's even more remarkable works in this genre. Two contemporaries of Schütz, Johann Hermann Schein (1586-1630) and Samuel Scheidt (1587-1654) were both important figures in German Reformation music.

Lully Purcell and Seventeenth-century Opera.

France resisted the tide of Italian opera although paradoxically it was an Italian, Jean Baptiste Lully (c. 1632-87) who charted the different course of French opera which was from the beginning associated with the court ballet. His musical monopoly during the reign of Louis XIV was put to good use. In his thirteen operas the libretto usually on classical allegorical themes plays a vital part in the composition which is therefore less clearly divided between recitative and aria than in Italian opera. The orchestration and the ballets assume greater importance than in the traditional Italian form. It was in short a more realistic less stylised art.

In England opera developed out of the entertainment known as the Masque a succession of dances accompanied by voices and instruments and often incorporated in a drama or spectacle. Henry Lawes's (1596-1662) setting of Milton's *Comus* is probably the most famous of these entertainments. The *Venus and Adonis* of John Blow (1640-1708) can be called the first English opera because here the music is gradually gaining the ascendancy over the spoken word. However it was Purcell (1658-95) Blow's pupil with *Dido and Aeneas* who really gave dramatic life to the new medium by giving his characters a true musical personality that was subtler than anything the mere spoken word could achieve. The grief laden lament of the dying Dido "When I am laid in earth" has an expressive power achieved by extraordinarily bold harmonic effects never before and seldom since achieved. The opera was in fact written for a young ladies boarding school. Purcell followed it with several outstanding semi-operas—such as *The Fairy Queen* (to Dryden's text). His untimely death at the age of 36 probably robbed us of several full length operas—and perhaps a consequence of this was that English music after him did not develop as it should have done.

His verse anthems and much of his instrumental music especially the Fantasia's are also rich in imaginative mastery through his original use of harmony and counterpoint. However a great deal of his pieces were written for a specific occasion and many of the odes are set to impossibly trite texts. At least his genius was partly acknowledged in his own day and he was appointed organist in Westminster Abbey where he was buried with due pomp. He is said to have died through catching cold when locked out of his own house at night.

Vivaldi and the Rise of Instrumental Music

Out of the dance suites popular in the 16th cent and the beginning of the 17th (known in Italy as the *Sonata da Camera*) developed the concerto. This began as two groups of instrumentalists compared and contrasted with each other as in Giovanni Gabrieli's *Sonata piano e forte*. With Arcangelo Corelli (1653-1713) the concerto grosso took a more definite shape alternating a solo group of instruments with the main body of strings in three or more contrasting movements. Giuseppe Torelli (1658-1709), Francesco Gemignani (1687-1762) and Tommaso Albinoni (1671-1750) were other notable contributors to the form, but none of the composers so far mentioned has today achieved the popularity of the priest Antonio Vivaldi (c. 1678-1741) himself a violinist who had at his disposal the orchestra at the Ospedale della Pietà in Venice. The young women at this music school also contributed the vocal side of the concerts there of which there are many descriptions. One says: They sing like angels, play the violin, flute, organ, oboe, cello, bassoon—in short no instrument is large enough to frustrate them. I swear nothing is so charming than to see a young and pretty nun dressed in white a sprig of pomegranate blossom behind one ear, leading the orchestra and beating time with all the grace and precision imaginable. For this body Vivaldi wrote about 500 concertos which maintain a remarkably even quality of which The Four Seasons are perhaps the most felicitous.

Meanwhile organ music was advancing rapidly in technique. Girolamo Frescobaldi (1583-1643) and Jan Pieterszoon Sweelinck (1562-1621) wrote works that provided the foundation of the Italian and Northern German schools of organ music. Their ricercars gradually developed into the fugue a vein so richly mined by Bach. Among their successors the most notable figure before Bach was Johann Pachelbel (1653-1706).

Other keyboard music, especially for the harpsichord, was the particular province of France and Jean Philippe Rameau (1683-1764) and François Couperin (1688-1733) were both masters of keyboard style and harmonic invention.

Bach (1685-1750)

The two giant figures of Bach and Handel bestride the first half of the 18th cent. Their differences are perhaps greater than their similarities. Bach wrote essentially for himself (although of course he had to satisfy his employers at Cöthen and Leipzig) while Handel was composing to please his wide public. Bach was a provincial always remaining in central Germany. Handel was widely travelled. Bach was devoutly religious almost ascetic. Handel was more a man of the world. They never met.

To summarise Bach's vast output in a short space is virtually impossible. One can only try to distil the flavour of his music. He brought the art of polyphony to the highest pitch of mastery that has ever been achieved or is ever likely to be achieved. In his famous Forty Eight and the Art of the Fugue he explored all the fugal permutations of the major and minor keys. At the same time his music rose above technical brilliance to achieve especially in his organ music the two Passions many of the church cantatas and the B minor Mass intense emotional and expressive power. The cantatas from his Leipzig appointment (1723) onwards were integrated into the services. They consisted usually of a chorus based on a Lutheran hymn tune, recitatives several extended arias and a concluding chorus usually a straightforward version of the hymn tune in which the congregation joined. There are some two hundred of these works and they contain a wealth of comparatively unknown and sometimes even unrecognized beauties. The St. John and the St. Matthew Passion extend the procedures to a grand scale, an Evangelist telling the new Testament story in vivid recitative, the chorus taking the part of the crowd, soloists pondering in arias on the meaning of the Gospel and Jesus's words being sung by a bass. Anyone who

has heard either of these works well performed cannot help but dismiss from his mind any idea of Bach as a mere dry as dust musical mathematician. In the St. Matthew Passion every suggestion in the text that can possibly be illustrated by a musical equivalent is so illustrated. The Old Testament Paraphrase law is represented by strict musical forms such as the canon. Christ's sayings are given noble arioso law and the arias reflect truly the New Testament's compassionate message. Technically the work is a marvel, expressively it is eloquent. The B minor Mass although it contains borrowings from many of his own works still stands as a satisfying monumental whole in which Bach's choral writing achieved a new richness the adaptations being in accord with their new setting.

Bach's instrumental music, especially the violin concertos and the unaccompanied works for violin and cello not only show the immense range of his powers but also contain many of his deeper thoughts whereas the orchestral suites and the Brandenburg concertos are more extrovert, particularly the rhythmically exuberant fast movements.

Bach closes an era—that of the later contrapuntalists—by achieving the *ac plus ultra* in fugal composition. His last incomplete work, the Art of the Fugue is evidence of this.

Handel (1685-1759)

During his lifetime Handel was far more widely recognised as a great composer than Bach and his music unlike Bach's maintained its place in popular esteem until the re-discovery of Bach and the dominance of the symphony placed Handel somewhat in the background.

During the latter part of the 19th cent. Handel's name was mainly associated with mammoth 'anachronistic' performances of a small sample of his oratorios at the Crystal Palace and elsewhere in England. In his lifetime these works and all his other works in the genre were sung by a small choir who were outnumbered by the instrumental players. Over the past few years authentic sized performances of his oratorios and a revival of interest in his operas have revealed the real Handel unknown to our grandparents.

The operas were neglected partly because the vocal prowess they required—and which the castrati so brilliantly supplied—was no longer available and because their dramatic life at least according to 19th and early 20th cent. tenets hardly existed. Now it is realised that this neglect has deprived us of an unending stream of glorious melody and of much daring harmony. But perhaps it is in the hitherto disregarded oratorios such as *Semele* that Handel's innate dramatic sense and musical range are to be heard gloriously fulfilled and the pastoral serenade *Acis and Galatea* is surely one of the most delightful scores ever composed.

Handel was a colourful imaginative orchestrator and this can be heard both in his accompaniment to vocal music and in his concerti grossi, op. 3 and 6 the earlier set exploiting a diversity of interesting string and wind combination. In his writing he was at home in a polyphonic or homophonic style as his superb choruses show. His organ concertos of which he was the inventor (to quote a contemporary source) were often played between the acts of his oratorios. They are alternately expressive and exuberant pieces calling for some virtuosity from the player. His occasional works such as the Water Music and Fireworks Music show his ingenuity in extending the range of the typical 17th cent. suite to serve a particular occasion.

Handel's working life was mostly spent in England where his Italian operas were acclaimed. In the years between his arrival here in 1711 and 1729 he wrote nearly thirty operas. It was only when the public tired of these and his reputation slumped that he turned to oratorio with equal success.

Bach and Handel between them crowned the age of polyphony that had lasted for two hundred years or more. After them it is hardly surprising that composers began looking for a new style already anticipated in the music of Rameau and particularly Domenico Scarlatti (1685-1757) whose harpsichord sonatas foreshadowed the classical sonata form that was to dominate music for the next two hundred years. The change in musical style about 1750 was partly the result of a change in musical patronage. Bach was the last great composer to earn his living through being employed by the church. The new patrons were the nobility who liked to have a composer on hand to write for the various evening entertainments of the time. For this purpose the princes and dukes had their own orchestras and their own small opera houses. The music required had to be elegant, formal, *galant*. Haydn was exceptionally fortunate in having an employer, Prince Nicholas of Esterházy who allowed him to write more or less as he wished so that he was able to develop symphonic form into something more than a pleasing way of passing an evening.

The early symphonists culminating in Haydn broke away from Bach's contrapuntal treatment of the orchestra. Instruments now came to be treated in a more colourful manner according to their particular timbres. The court of Mannheim had an orchestra of a standard unheard hitherto and Johann Stamitz (1717-57) and his son Karl (1745-1801) influenced the great composers who were to follow in their footsteps. The composition of their orchestra was flexible: oboes, flutes and horns often being added to the standard string section. Bach's son Carl Philipp Emanuel (1714-88) added to and developed symphonic and sonata form especially as regards keys and subjects.

Haydn and Mozart

These two figures dominate the second half of the 18th cent as Bach and Handel did the first. In a brief space only a general picture can be presented of their huge output and influence. Of Haydn's 104 symphonies (there may even be others) more than half are worthy of study and hearing. The craftsmanship is always remarkable, the invention ever new. Indeed without Haydn's harmonic daring or his melodic ingenuity the even greater symphonic thought of Beethoven would have been impossible. Haydn laid the groundwork on which his successor built towering edifices. A work such as the 93rd symphony in D is typical of his mature style with its searching introduction, powerfully wrought earnestly argued first movement, beautiful *Largo* and resourceful bustling finale. Haydn did not fight shy of contrapuntal writing: the development section of this symphony's first movement and the finale are evidence of that, but it was only as an integral part of a predominantly homophonic technique.

Mozart's symphonies are not so different in form from Haydn's but—and this must be a subjective judgment—he put more emotional feeling into his. Nobody could listen to the heart-searching first movement of his 40th symphony without being deeply moved. It was in his final three works in the medium that Mozart brought his symphonic art to perfection and these obviously had an effect on Haydn's later symphonies written after them. For passion and tenderness contained within a classical form these late symphonies and many other of Mozart's works have yet to be surpassed.

Haydn who has been rightly termed 'the Father of the Symphony' was also the founder of the string quartet—perhaps the most perfect because the most exactly balanced, form of musical expression. The four instruments—two violins, viola and cello—discuss, argue, commune with each other over the whole gamut of feeling. In his quartets Haydn's mastery of structure is even more amazing than in his symphonies. Mozart's quartets (especially the six devoted to Haydn) and even more his quintets achieve miracles of beauty in sound nowhere more so than in the first movement of the G minor (his most personal key)

quintet. The two late piano quartets show how the piano can be ideally combined with strings. His clarinet quintet is also a masterly work.

Haydn did not leave any concertos of consequence. Mozart's especially those for piano are among his greatest works. As a brilliant clavier player himself he showed a consummate skill in writing for the keyboard. Although the instrument he knew was slightly less advanced than the piano today, his concertos call for virtuosity in execution yet they are as searching in emotional content as the late symphonies and quartets. Indeed the C major concerto (K. 467) and the C minor (K. 491) may be said to hold the quintessential Mozart. As well as twenty (mature) piano concertos, Mozart wrote six for the violin, four for the horn and eighteen others, but none of these delightful as they are, can be placed in quite the same class.

Of their church music Haydn's sixteen masses and his oratorios—*The Creation* and the *Seasons* (both late works)—are perhaps more worthy of attention than Mozart's various masses, but we must not forget Mozart's final work—the Requiem or the serene late Motet *Ave Verum Corpus*.

Eighteenth-century Opera

Mozart—for many the first great opera composer—did not of course create his masterpieces out of nothing. In France Lully was followed by Rameau (1683-1764) who carried on his tradition of using classical themes but developed a more flexible style of recitative and greatly increased vividness of expression. But it was Gluck (1714-87) who more than anyone broke out of the straitjacket of the now ossified Italian form of opera—dominated by the singer—and showed just what could be achieved in moving human terms. Drama in music really came of age with his *Orfeo e Euridice* (1762), *Alceste* (1767) and *Iphigénie en Tauride* (1779). His simplicity and poignancy of expression were not lost on Mozart.

Meanwhile in Germany a kind of opera called *Singspiel* appeared during the 18th cent. Breaking away from classical themes, mundane stories were told in dialogue and music.

Until quite recently Haydn's operas were dismissed as unworthy representations of his genius but chiefly through the enlightening efforts of the Haydn scholar H. O. Robbins. Landon, some of his fifteen surviving works in the medium have been successfully revived. They have proved to be perfectly viable for the stage and especially in the ensembles full of that delightful invention to be found in the rest of his opus if on a less fully developed scale. Still as musical drama they inevitably fall far short of Mozart's achievements for the younger composer seems to have had an instinctive feeling for the stage. Into his operas he poured his most intense personal music. He vividly portrays the foibles, desires, loves and aspirations of mankind.

The earlier, immature stage pieces of his youth led to such works as *Lucio Silla* (1772) and *La Finta Giardiniera* (1775) with their first glimpses of the glories to come. His first indubitably great opera is *Idomeneo* (1781). Despite its unromantically static plot, *Idomeneo* reveals Mozart's stature through its ability to breathe new life into a conventional opera seria form. Though influenced by Gluck it is yet more human and touching in its musical expression. To succeed this Mozart wrote a much more frivolous piece *Die Entführung aus dem Serail*. Stemming from the *Singspiel* tradition, it none the less creates real life characters who have much charming music to sing.

After three lesser pieces Mozart embarked on his four masterpieces—*Le Nozze di Figaro* (1786), *Don Giovanni* (1787), *Così fan tutte* (1790), and *Die Zauberflöte* (1791).

Figaro as well as being a delightful comedy explores more fully than any previous opera situation and character which find expression in

beautiful airs and in two finales of symphonic proportion. In *Don Giovanni* less satisfactory as a dramatic structure, the range of musical characterization and insight into human motives is widened still further (*Così*) lyrically but humorously expresses the follies of love. Mozart could not help but love his characters and his music for them is at one and the same time amusing and heartfelt. *Die Zauberflöte*—The Magic Flute—displays Mozart's deep felt love of his fellow men and of truth in an opera of great spiritual strength. Nor has opera any more lovable personality than the birdcatcher Papageno. Mozart's final opera *La Clemenza di Tito* extolling imperial magnanimity has never achieved the success or popularity of his other maturer stage works though it contains much excellent music.

Beethoven

Mozart was the last major composer to depend to any large extent on private patronage for his living and even he left the service of the Arch bishop of Salzburg because he could not stand the restrictions imposed on his freedom. Henceforth composers would have to stand on their own two feet with all the advantages (liberty) and disadvantages (lack of security) that implied. Beethoven (1770-1827) was the first such composer of importance.

Although his work is usually divided into three periods this division is somewhat too arbitrary for no other composer in history with the possible exception of Wagner has shown such a continual development of his genius. Coming at just the right moment in musical history he crowned the achievements of Haydn and Mozart with music of the utmost profundity of thought and feeling that looks back to its classical heritage and forward to the romantic movement of the 19th cent. His influence on musical thinking and writing is incalculable.

His first period shows his strong melodic gifts and the beginning of his individuality in developing form and structure to suit his own ends and match his particular genius. Unusual keys are explored, unusual harmonic procedures employed. With the *Eroica* (his third symphony) he established his position as a great composer. The unity of purpose he here achieved within a long and diverse structure is truly staggering even today. In the first movement alone the structural invention and cogency went far beyond what even Mozart had achieved in his *Jupiter* symphony and the second movement—a vast funeral March—has an overwhelmingly tragic emotional content. But the *Eroica* was followed by six equally great symphonies each one as varied as inventive as unified as the others. The ninth symphony is significant in both its length and finale. Here Beethoven crowns three superb instrumental movements with a choral movement that as well as summing up all that has gone before expresses in music the joy in existence more ecstatically than any other work.

The burning intensity of Beethoven's genius is just as evident in his chamber music. His quartets are the product of a revolutionary era in which the social graces and formal restraint of the 18th cent were thrown off in a search for a more personal mode of expression. The early op. 18 set and the Razoumovsky quartets op. 59 go even beyond the range of Haydn's and Mozart's works in the medium but it was in his late quartets his final musical testament that Beethoven refined and distilled his art for posterity. No words can possibly describe their unique quality but any and every chance should be taken to make their acquaintance the effort required will be more than amply rewarded.

The early piano concertos do not reach quite this level of attainment but the last three together with the violin concerto are on a par with the finest of the symphonies and quartets as well as being considerable tests of the performers' technique. The Triple Concerto for piano, violin, and cello is an unusual and rewarding work.

Beethoven's grandest choral work—and one of the most noble in existence—is the *Mass in D (Missa Solemnis)*. Its vast scale and sublime utterance often defeat performers but when it is successfully done there is no more spiritually uplifting experience for the listener. Except perhaps Beethoven's only opera *Fidelio*. This simple escape story was transformed by Beethoven's creative fire into a universal symbol of liberty the composer identifying himself with the struggle for freedom from tyranny and release from darkness.

Beethoven lived in a period of war and revolution. A passionate belief in the brotherhood of man and in liberty he was shocked to find his ideals thrown over by revolutionaries turned dictators. His own tragedy of deafness which came upon him at the moment of his triumph nearly submerged him but in the end he won through and produced the string of masterpieces from the *Eroica* onwards. Hope springing from despair, love from hatred, victory over defeat these are the unquenchable legacies left by Beethoven.

The Romantic Movement

Inevitably the Romantic movement in literature that burst forth about 1800 was bound to have its counterpart in music and so it was. Breaking the classical bonds composers such as Schubert, Schumann, Liszt, and Berlioz sought a new freedom in musical expression. Form became of less importance than content and that content often had literary connections. For their purposes a larger orchestra was needed and supplied but the miniature the song especially because of its very personal connotation was also a favourite form.

Schubert (1797-1828)—described by Liszt as the most poetic of musicians—is perhaps the greatest lyrical genius in musical history. In him the Viennese tradition and influence of Haydn, Mozart and Beethoven reached its zenith. The song was always Schubert's starting point so it is hardly surprising that his reputation as a song writer has never been impaired but in his symphonic and instrumental works too it is always his inexhaustible fund of melody that first calls for attention. Nobody could listen to his Trout quintet for piano and strings his octet his fifth symphony or his song cycle *Die Schöne Müllerin* without being enchanted and invigorated by the sheer tunefulness of the music. But there is much more to Schubert than this: his understanding of the possibilities of harmonic change his grasp of orchestral coloration (in the great C major symphony for instance) his free use of sonata structure.

Although Mozart, Haydn and Beethoven had all contributed to the song as an art form it was with Schubert that it achieved its first full flowering. If he had written nothing but his songs his place in the musical firmament would be assured. With his *Erlikönig* in 1815 the German *Lied* came of age and from then until the end of his life he wrote more than six hundred songs hardly a dud among them. Whether it is the charm of *Heiden röslein* the drama of *Der Doppelgänger* or the numbed intensity of the *Winterreise* cycle Schubert unerringly went to the heart of a poet's meaning, indeed he often raised poor verses to an inspired level by his settings. And for the first time the pianist shares a place of equal importance with the singer.

There is only room to mention one or two other composers some of them wrongly neglected who were roughly contemporaries of Beethoven and Schubert. The Czech Dussek (1769-1812) who like Beethoven bridges the classical-romantic gulf. Boccherini (1743-1805) the two Italian opera composers Cimarosa (1749-1801) and Paisiello (1740-1816) the Frenchman Méhul (1763-1817) and the German Hummel (1778-1836).

Weber (1784-1826) lacked Beethoven's energy and constructive powers and Schubert's sheer lyrical profundity but he is an important figure especially in the field of opera where his *Der*

Treuschütz and *Oberon* led the way to a more flexible dramatically realistic form of opera. His vivid imagination exactly fitted the new romantic mood abroad. The sheer beauty in the melodic shape of his music is also not to be denied.

Mendelssohn and Schumann

Mendelssohn (1809-47) was the civilised craftsman among the Romantic composers. A boy genius—many of his finest works were written before he was twenty—he maintained the importance of classical form while imbuing it with his own affectionate brand of poetic sensibility. His third and fourth symphonies—the Scottish and The Italian —(and possibly the fifth The Reformation) his string quartets (some of which go deeper than most of his music) violin concerto first piano concerto and of course the incidental music to A Midsummer Night's Dream represent his tidy yet effervescent style at its most winning.

Schumann (1810-1856) is less easy to categorise. His early romantic flame was burnt out by some flaw in his intellectual and/or emotional make up and his inspiration seems to have declined in later years. No matter by then he had given us the marvellous song cycles of 1840 an ever fresh piano concerto many fine piano solos including the mercurial popular *Carnaval* and several symphonies which if not structurally perfect contain much lovely music. The joys and sorrows of love and the feeling for natural beauty are all perfectly mirrored in these charming lyrical works.

Romantic Giants

Berlioz (1808-69) and Liszt (1811-86) are the two most typical representative figures of the Romantic era. Both have always been controversial figures with ardent advocates and opponents either unduly enthusiastic or unfairly derogatory. Berlioz would be termed the perfect painter in music. With an uncanny mastery of orchestral sound he could conjure up the countryside the supernatural and the historical with the utmost ease. He based his music on the direct reaction to feeling and a desire to illustrate literature by musical means. That his technical expertise was not always the equal of his undoubted genius can be heard in many of his larger works such as the dramatic cantata *The Damnation of Faust* and the dramatic symphony *Romeo and Juliet* yet most people are willing to overlook the occasional vulgarity for the ineffable beauty of his many fine pages but brutal cuts in his music such as are often made in for instance his epic opera *The Trojans* only have the effect of reducing the stature of his works. We must accept himwarts and all. Anyone who has seen the two parts of *The Trojans* presented complete in one evening at Covent Garden will realise that Berlioz knew what he was about.

His output is not quantitatively large but in cludes several monumental works as well as *The Trojans*. The *Requiem* (Grand Messe des Morts) requires a tenor solo huge chorus and orchestra and brass bands although Berlioz uses these forces fastidiously. The *Symphonie funèbre et Triomphale* calls in its original form for choir brass and strings. But Berlioz was just as happy writing on a smaller scale as his exquisite song cycle to words of Théophile Gautier *Nuits d'été* shows. Gautier perhaps summed up better than anyone Berlioz's singular talent. In that renaissance of the 1880s Berlioz represents the romantic musical idea the breaking up of old moulds the substitution of new forms for unvaried square rhythms a complex and competent richness of orchestration truth of local colour unexpected effects in sound tumultuous and Shakespearean depth of passion amorous or melancholy dreaminess longings and questionings of the soul infinite and mysterious sentiments not to be rendered in words and that something more than all which escapes language but may be divined in music.

During his lifetime Liszt was fêted and honoured not only by his musical colleagues but

by the world at large which idolised him and his music. Then his reputation took a plunge from which it has only recently recovered. To be sure much of his early music is glitter and gloss but his symphonies and tone poems—especially the *Faust* Symphony the *Dante* Symphony (both of course inspired by literature) and *Orpheus* and *Prophetes*—and his late piano works show that he was an extraordinary harmonic innovator. The piano sonata in B minor brings his romantic wilful temperament within a reasonably stable pragmatic form and as such is a landmark in the repertory of the instrument. Liszt's output was prodigious but the inquiring listener should explore the more original of his compositions already mentioned to form a true picture of his fertile genius.

Chopin

Chopin (1810-49) was the master of the keyboard par excellence. His development of the technical and expressive capabilities of the piano is unique in musical history. His inventive powers were poured out with nervous passionate energy and in a highly individual style through twenty astonishing possibly agonised years of creative activity before his early death. A Chopin melody limpid transparent singing can be recognised easily by anyone but his style gradually developed into something more subtle more satisfying than pure melody. He took the greatest care of every detail so that any alteration however small upsets the perfect balance of his work. His poetic sensibility can be found in any of his works for his constructive ability we must turn to the *Ballades* the *B minor Sonata* and the *Barcarolle* while the *Preludes* and *Studies* blend technical powers and emotional expressiveness in ideal proportions.

Nineteenth century Opera.

After Mozart's operas and Beethoven's *Fidelio* the medium might have been expected to decline. Instead it took on a new if different lease of life that culminated in Verdi's extraordinary output.

Rossini (1792-1868) created a world of exuberant high spirits in his operatic works that are as cheerful and heart warming today as they were a hundred or more years ago.

He always worked in and around the lyric theatres of Italy and between 1810 and 1830 poured out a stream of works not all of which can be expected to be masterpieces. However *Il Barbiere di Siviglia* *L'Italiana in Algeri* *La Cenerentola* and *Le Comte Ory* will always delight audiences as long as opera houses exist. Although these works are difficult to sing really well their vitality and charm can never be submerged even by poor voices or indifferent staging.

His German contemporaries were critical of his confidence and frivolity but his works show a consistency of invention and an irresistible tunefulness that anyone might envy. In recent years there has also been a renewed interest in his more serious operas—*Otello* (1816) *La Gazza Ladra* (1817) *Semiramide* (1823) *La Sœur de Corinthe* (1820) and *Guillaume Tell* (1829)—which were certainly surpassed in dramatic power by his successors but which nevertheless are not to be despised or neglected.

William Tell to give it its more popular title was his last work for the stage although he lived on for nearly forty years in retirement in Paris some of many of his greatest successes. There he enjoyed good living dispensing *bons mots* and occasionally composing trifles. An exception is the unpretentious *Pelle Messe Solennelle* written originally for soloists chorus a harmonium and two pianos. Rossini later orchestrated it but he would not allow it to be performed during his lifetime. The first public performance was on 28 February 1869 as near as possible to the 78th anniversary of the composer's birth on Leap Year Day 1792.

In contrast to the mercurial Pissini Vincenzo Bellini (1801-1835) was an exquisite romantic figure dealing with exquisite romantic stories an operatic equivalent to Chopin who much admired him. His delicate sinuous vocal line (in the arias) and brilliant acrobatics in the final sections (cabalettas) require singers of the utmost accomplishment to do them justice although his music is never as florid as Rossini's. His most typical and popular works are probably *La Sonnambula* (1831), *Norma* (1831) and *I Puritani* (1835). The first is a tender homely country story the second an almost heroic lyrical drama of sacrifice and the third a rather unsatisfactory historical story redeemed by its appealing music. In the past few years singers of the calibre of Maria Callas Joan Sutherland Guletska Simionato and Marilyn Horne have brought Bellini's operas a popularity almost equal to that they enjoyed at the time they were written.

Gastano Donizetti (1797-1848) was an even more prolific operatic composer than Rossini. He wrote at least 75 works mostly for the Italian stage several of which such as *Alfredo il Grande* or *Emilia di Liverpool* are never likely to be revived but during the past few years with the renewed interest in what are called the *Olgettato* operas many of his serious operas have been resuscitated and found as enjoyable in performance as his more frequently heard comedies.

He was a well grounded musician and although his invention is often criticised for being too tied to the conventions of his day performances often belie this reputation his dramatic instinct proving sure. *Lucia di Lammermoor* because of the chances it offers to a coloratura soprano with tragic pretensions has always held the stage and of late *Lucrezia Borgia* *Anna Bolena* *La Favorita* and *Poltava* have all been successfully revived. Of his lighter works the comedies *L'Elisir d'Amore* and *Don Pasquale* have never declined in popularity. One of his last works was *Linda di Chamounix* (1842) which he wrote for Vienna where it aroused such enthusiasm that the Emperor appointed him Court Composer and Master of the Imperial Chapel.

French Opera

The taste in Paris was for more and more lavish productions. Following Spontini (1774-1851) whose works were comparatively austere came Halévy (1799-1862) and Giacomo Meyerbeer (1791-1864) whose operas contain all the ingredients that came to be expected of Grand Opera—spectacle huge ensembles showpieces for the soloists and extended if superfluous ballet. Drawing from Italian, German and French traditions Meyerbeer's music contained everything the public wanted yet today they are seldom revived perhaps because his creative powers were essentially derivative yet when they are given operas like *Les Huguenots* *Le Prophète* and *L'Africaine* still have the power to fascinate and his influence on his successors notably Wagner was considerable.

Verdi

Italian opera in the 19th cent. culminated in the works of Giuseppe Verdi (1813-1901) who rose from a peasant background to become his country's most noted composer as well as something of a natural hero during the period of the Risorgimento. His earliest works indeed often roused his hearers to patriotic fervour. For instance *Nabucco* (1842) with its theme of an oppressed people seeking deliverance was treated as a symbol of the Italians' fight for freedom.

Musically Verdi developed out of all recognition during the course of his long career. The continuously flowing structure of his last two operas *Otello* and *Falstaff* is very far removed from the start-stop formulas inherited from his predecessors of his first works, yet even they are touched, in harmonic subtleties, orchestral felicities and a sense of drama, by a spark of genius a burning inspiration that sets him apart from all other

operatic composers. *Evans* (1844) *I due Foscari* (1844) and *Luisa Miller* (1849) all have foretastes of glories to come even if as a whole they are flawed dramas and these grilles years as Verdi himself later described them gave him the essential know how to produce his later greater operas as well as establishing him incontrovertibly as the most popular Italian composer of the time.

However it was with *Trigoletto* (1851) *Il Trovatore* (1853) and *La Traviata* (1853) that Verdi first really staked his claim to immortality. In these pieces his increasing dramatic mastery are married to a wonderful flow of lyrical melody at the same time controlled by a fine musical sensibility. They were followed by four operas—*Simon Boccanegra* (1857) *Un Ballo in Maschera* (1858) *La Forza del Destino* (1862) and *Macbeth* (revised version 1865)—in which Verdi overcame complexities of story line by his continually developing musical powers. This period is crowned by *Don Carlos* (written for the Paris Opéra 1867) a masterly exercise in combining private and public situations in a single grand and characterful work. In some respects Verdi never surpassed the subtlety of his writing in this opera. *Aida* (1871) carried on the process but the characterisation in this ever popular piece is less refined than in *Don Carlos* if the grandeur of the design is more spectacular.

The success of *Otello* (1887) owes nearly as much to the skill of Boito whose literary ability combined with musical knowledge (he was himself a composer) presented Verdi with an ideal libretto for his seamless music in which the drama moves inevitably to its tragic end. Recitative aria ensemble are fused in a single swiftly moving music drama which in its very different way equals that of Wagner. *Falstaff* (1893) achieves the same success in the field of comic opera a brilliant mercurial ending to a distinguished career. If Verdi had written only these two final masterpieces his place in musical history would be assured.

Brahms

Brahms (1833-1897) has justly been described as a romantic spirit controlled by a classical intellect for while complying with most of the formal regulations of sonata form he imbued them with an emotional content that accorded with his time. Indeed Schumann declared that he was the one man who would be singled out to make a cadenza in an ideal way the highest expression of our time.

Perhaps in his chamber music will be found the quintessence of his art. The piano and clarinet quintets the two string sextets the horn trio and the violin sonatas all are designed on a large scale yet the expression remains intimate the design and structure clear.

The symphonies and concertos though remain his most popular works they are part of the solid repertory of every orchestra and most piano and violin players in the world. Their high seriousness constant lyrical beauty and control of form are deeply satisfying. They do not provide the extremes of passion and excitement provided by his contemporaries but their study provides continuous absorption and delight. The double concerto for violin and cello deserves a mention as a unique work in music.

Brahms wrote more than two hundred songs in which the desire for melodic beauty takes precedence over the words and meaning. Many are set to poor poetry but hidden away are still some unexplored treasures and the Four Serious Songs at least are tragic masterpieces. In a lighter vein the two sets of *Liederteller Walzer* for four voices are irresistible. The choral Requiem too is a fine work.

Bruckner

In recent years Bruckner's reputation vis-à-vis his great contemporary Brahms has been enhanced in England. The old conception of him

as a naive Austrian unable to grasp the fundamentals of symphonic architecture has died hard and the prevailing popularity of his grandest works is at last gaining him his rightful place in the 19th cent. firmament. The nine symphonies and the masses are his chief claim to immortality. They contain melodies of unforgettable beauty symphonic paragraphs of unparalleled grandeur and an appreciation of formal development that though different is as equally valid as that of Brahms. The movements of his symphonies are long and he often pauses as if for breath and to admire the scenery before he reaches the climactic peak of his musical journey. His idiom is best approached by a newcomer to his work through the fourth and seventh symphonies as they are perhaps the easiest to understand but the fifth sixth eighth and ninth (unfinished) are just as beautiful—and cogently argued—once one has acquired the knack so to speak of listening to his music. Most of these works are now to be heard in their original form stripped of the veneer of improvements suggested to the diffident composer by his friends.

As well as the masses which translate Bruckner's symphonic ideas to the choral plan Bruckner's delightful string quintet is worth investigation.

Wagner

Praised only this side of idolatry by his admirers unmercifully criticised by his detractors Richard Wagner (1813-83) is perhaps the most controversial composer in musical history. And so it was bound to be with such a revolutionary figure whose writings other than his music contain to say the least dubious theories and whose operas composed to his own libretti broke the bonds of the form as known until his time. He regarded music drama as a fusion of all the arts—music literature painting—in one unity. With *The Ring of the Nibelungs* he achieved his purpose no other work of art has ever tried to encompass the whole of existence. Today and surely for ever musicians philosophers and writers will argue over its meaning and each age will reinterpret it according to its own lights.

But before he reached this pinnacle of achievement Wagner gradually transformed opera—through *Rienzi*, *The Flying Dutchman*, *Tannhäuser* and *Lohengrin*—so that a new mould was fashioned to take what he wanted to pour into it. He introduced the *Leitmotive* a musical theme that could be associated with a particular person situation or idea each time it occurred. Slowly he developed the musical form so that the drama could unfold continuously without breaks for arias. By the time he began to write *Tristan and Isolde* and *Die Meistersinger* he had perfected his methods and had he never undertaken *The Ring* that tragedy and that comedy would have assured him his place in the musical firmament. Indeed *Die Meistersinger* is considered a masterpiece even by those who are not willing or prepared to accept the rest of the Wagnerian ethos.

The length and complexity of these operas and of *Parsifal* a work of unique beauty in spite of certain *longueurs* means that it is almost essential to prepare oneself by homework with libretti and records before attempting to assimilate them in the opera house. The added effort is well worth while for the ultimate musical satisfaction they bring because Wagner was more than an operatic reformer. He opened up a new harmonic language (especially in the use of chromaticism) that was logically to develop into the atonality of the 20th cent.

Wolf

As Wagner was the culmination of the 19th cent. symphonic and operatic tradition so Hugo Wolf (1860-1903) summed up if he did not surpass the achievements in song writing of Schubert Schumann and Loewe (1798-1889).

Wolf was a lonely pathetic man. He lived much of his life in poverty and eventually lost

his reason and died of an incurable disease. These circumstances account perhaps for his almost feverish bursts of creative activity which were also the outward sign of his burning genius. His greatest contributions to the art of *Lieder* were his extraordinary insight into the poet's meaning and the harmonic means by which he heightened the expression of the words. He raised the importance of the piano part even higher than had Schumann and in some of his songs the vocal part takes the form of a free declamation over a repeated idea in the piano. However in the main the vocal and piano parts are interwoven with great subtlety and he unerringly matched the very varied moods of the poems he chose to set. His greatest creative period was between early 1888 and early 1890 when songs poured from his pen daily—more than 50 settings of the German poet Mörike 20 of Eichendorff more than 50 of Goethe and more than 40 of Heyse and Geibel (the Spanish Song book). Later he composed songs from Heyse's Italian Song book and the three Michelangelo sonnets. And the range of his creative understanding was wide taking in the almost wild passion of the Spanish songs the humanity and humour of the Italian love songs the titanic power of *Prometheus* (Goethe) the varying moods of the Mörike book and the intangible power of the Michelangelo sonnets. There are almost inexhaustible riches here for the inquiring mind to discover. Outside *Lieder* Wolf's output is small but it includes a sadly neglected opera *Der Corregidor* the Italian Serenade for string quartet (alternatively for small orchestra) and a tone poem *Penthesilea*.

Ernest Newman has greatest champion summed up his work most aptly. Wolf practically never repeats himself in the songs every character is drawn from the living model. It is a positively Shakespearean imagination that is at work—Protean in its creativeness inexhaustibly renewed and always functioning from the inside of the character or the scene not merely making an inventory from the outside.

National Movements

During the course of the 19th cent. alongside the emergence of national political identity came the rise of nationalism in music fertilising traditional Western—that is basically German—musical forms with folk material. Of these groups the Russian is certainly the most important if not the most vital.

Glinka (1804-57) was the first important Russian composer of the national school and although his two operas *A Life for the Tsar* (some times called *Ivan Susanin*) and *Russian and Ludmilla* are strongly influenced by Italian models they do introduce Russian song and harmony into the texture. He undoubtedly influenced Borodin (1833-87) Cui (1835-1918) Balakireff (1837-1910) Mussorgsky (1839-81) and Rimsky Korsakov (1844-1908)—the so called Five of 19th cent. Russian music. However each was very much of an individualist too. Borodin was a lecturer in chemistry who wrote in his spare time. His two symphonies two string quartets led up to his most notable work the opera *Prince Igor* left incomplete at his death. Balakireff friend and adviser to the rest of the group wrote little himself but his orchestral works and the piano fantasia *Islamey* are worthy of investigation.

Modest Mussorgsky (1839-81) is today seen as the most important and inspired of The Five. More than the others he used Russian song and Russian speech as the basis of his operas in which he portrayed the lives and destinies of his own people. Although his capacities were seriously impaired by an uncongenial job poverty and drinking he produced two great operas *Boris Godunov* and *Khovanshchina* and another *Sorochinsky Fair* that is immensely enjoyable. *Boris* should be given in its original, with spare orchestration, but more often than not it is heard in Rimsky Korsakov's more elaborate revision. In any case the opera exists in various versions, none of them necessarily the right one. What is it?

portant is to hear it in one or the other because of its great portrayal of Boris's personality set against the background of the Russian people unforgettably presented in choral outbursts. *Kholanshchina* was completed by Rimsky Korsakov. *Sorochintsy Fair* by Tcherépina (al though other versions also exist). Mussorgsky's songs explore a new vein of naturalistic vocal declamation. Each of the four *Songs and Dances of Death* is a miniature drama worthy of Wolf although of course in a quite other idiom. The *Nursery* songs miraculously conjure up a child's world as seen from a child's point of view. Many of the individual songs the *Sunless* cycle too should be investigated.

Rimsky Korsakov (1844-1908) is perhaps a less attractive figure because so much of his music seems heartless or merely decorative but this judgment is probably made on the strength of hearing *Scheherazade* and the *Capriccio Espagnol* a few too many times. Such of his 15 operas that are played evince a (literally) fantastic mind and lyrical vein and it is a pity that *Sadko*, *The Snow Maiden* and *The Tsar's Bride* at least are not heard more often.

Tchaikovsky

Peter Ilyich Tchaikovsky (1840-93) is a more universally admired figure than any of The Five and his music is undubitably closer to the mainstream than theirs in that it adheres more nearly to Western European forms. His popularity is due to his unhesitating appeal to the emotions and to his tender often pathetic melodic expression. His lyrical gift is stronger than his sense of architecture as he himself admitted. Yet his later symphonies—the fourth fifth and sixth (the *Patriotic*)—are all cogently enough argued and invigorating as can be heard in the hands of a conductor willing to emphasise their formal power rather than their tendency towards sentimentality. The orchestral craftsmanship is also superb. The three piano concertos and the violin concerto offer rare opportunities for virtuoso display within a reasonably dramatic structure and his various overtures are always exciting to hear.

The three ballets—*The Sleeping Beauty*, *Swan Lake* and *Nutcracker* show Tchaikovsky's skill on a smaller and perhaps more congenial scale but only two of his operas—*Eugene Onegin* and *The Queen of Spades*—survive in regular performance. They demonstrate his ability to delineate character and his always eloquent melodic invention. His songs often felicitously capture a passing mood or emotion.

Bohemia (Czechoslovakia)

The Czech national school is dominated by two composers—Smetana (1824-84) and Dvořák (1841-1904). In his own country Smetana holds a unique position as the father of his country's music—which is remarkable when you consider that he lived in a country that was then under Austrian rule and never spoke the Czech language perfectly. Yet his music is filled with the spirit of Czech history and national life and many of his operas his most important contribution deal purely with national subjects. The reawakening of interest in things national after Austria's defeat by Italy in 1859 led to the establishment of a Provisional Theatre in 1862 and Smetana's first opera *The Brandenburgers in Bohemia* was produced there in 1866 but its success was eclipsed by the enormous popularity of *The Bartered Bride* which appeared the same year. Its melodic charm lively characterisation and cosy humour have carried it round the world and it is the one Smetana opera to be in the repertoire of most opera houses. However his next opera *Dalibor* (1868) is considered by some authorities as his masterpiece. It is conceived on a heroic scale and frequently rises to great dramatic heights. His later operas include *Libuše* (1872) a solemn festival tableau, *The Two Widows* (1874) a delightful comedy, *The Kiss* (1876) *The Secret* (1878) and *The Devil's Wall* (1882).

His main orchestral work *Má Vlast* (My Country) written between 1874 and 1879 is a cycle of six symphonic poems nobly depicting the life and legends of his country. He wrote only three mature chamber works—an elegiac piano trio written in 1855 in memory of the death of his eldest daughter and two string quartets both autobiographical. The first in E minor (1876)—

From My Life—tells of his youth and aspirations until a terrible screaming E in *dissonance* describes the onset of deafness. The second in D minor sadly neglected was described by the composer as an attempt to explain the whirlwind of music in the head of one who has lost his hearing and was probably influenced by Beethoven's later music.

Dvořák combined a fecund melodic gift with an intelligent grasp of structure. His symphonies and chamber music are mostly written in classical form yet the works are imbued with a spontaneity and freshness that have not lost one whit of their charm over the years.

He wrote nine symphonies and although only the last three or four are regularly performed they are mostly mature works several of which for instance No. 7 in D minor (formerly known as No. 2) reach a tragic grandeur at times. They are all orchestrated in a masterly way and are full of delightful detail. Dvořák wanted to show that a Brahms could come out of Bohemia—and he succeeded in doing so while maintaining a definitely individual flavour strongly influenced by natural rhythms.

He wrote three concertos one each for piano violin and cello. The earlier ones are interesting without being quite in the first flight of the composer's output but the cello concerto of 1885 is perhaps the composer's crowning achievement—warm mellifluous romantic.

He wrote chamber music throughout his long creative life. Some of the early works are weak and derivative but the later string quartets the

Dumky trio and the piano quartet and quintet are expressive and full of unforced invention. Dvořák felt himself somewhat hampered when setting words nevertheless his *Slavos Mater* and *Te Deum* are both deeply felt choral works and he wrote songs throughout his career many of them very fine indeed. He wrote ten operas but only *Rusalka* (1901) has gained a foothold outside Czechoslovakia.

Janáček

The Moravian composer Leoš Janáček (1858-1928) spent most of his life in Brno as a working musician. His music has recently come to be recognised as some of the most original written in the past hundred years. His operas in which he closely followed the inflection of the speech of his native land are his finest works. Over the score of his last opera *From the House of the Dead* he wrote the words. In every human being there is a divine spark and it is this deep love of humanity that permeates all his works. Of his operas *Káťa Kabanová* (1921) and *The Cunning Little Vixen* (1924) the *Makropoulos Affair* (1926) and *From the House of the Dead* (adapted from a Dostoyevsky novel 1928) are the most important and they have all been produced in Britain in recent years. His original genius is self evident in all of them.

Among his orchestral works *Taras Bulba* and *Sinfonietta* should be noted and his two string quartets very difficult to play should be better known. The song cycle *Diary of one who has disappeared* for tenor contralto and three female voices with piano and the Glagolitic Mass contain music of much expressive beauty.

Hungary

The Hungarian musical outburst came some what later than that in other countries. Its great figure is Bela Bartók (1881-1945) who as well as being a national figure has proved an influential composer in the whole of 20th cent music. His

mind was full of folk music but it was transmuted by his strongly personal style and powerful intellect into something highly original. His music is tense and volatile but this restlessness is somewhat relieved by a kind of otherworldly ethereal lyricism as in the lovely slow movements of his quartets.

Bartók was affected as much by the musical innovations of Debussy and Stravinsky (see below) as by East European, notably Magyar folk music and many of his works are an attempt to meld the two.

The most important part of his output is undoubtedly his string quartets which cover most of his creative life. To this intimate form he confided his personal innermost thoughts and in it conducted his most far-reaching musical experiments thereby extending its boundaries beyond anything previously known. As with Beethoven's late quartets many of Bartók's rely on organic or cyclic development while remaining just within the laws of classical form. As Mosco Carner puts it: "For profundity of thought, imaginative power, logic of structure, diversity of formal details and enlargement of the technical scope they stand unrivalled in the field of modern chamber music."

The most important of his orchestral works are the three piano concertos of which the first two are harsh and uncompromising and fiendishly difficult to play while the third written in 1945 is mellower and more diatonic. The second violin concerto (1937-8) shows the various elements of Bartók's style in full flower by turns exuberant, passionate and brilliant. The *Music for Strings, Percussion and Celesta* (1937) is remarkable for its strange sonorities and its fascinating texture. The *Concerto for Orchestra* (1944) is more immediately appealing and again shows the composer in complete command of a large canvas. Of the piano works *Mikrokosmos* (1935) and the sonata for two pianos and percussion (1937) are especially to be noted.

His chief stage pieces are *The Marvellous Mandarin* (1919) a harsh cruel ballet which drew appropriately dramatic music from the composer and the opera *Duke Bluebeard's Castle* (1911) a luscious original score that makes one regret that he wrote no more operas later in his career.

Kodály (1882-1967) was from early years closely associated with Bartók and with him collected Hungarian folk melodies using many of them in his music. He worked in many forms and the more important of his works are the *Peacock Variations* for orchestra, the choral *Psalmus Hungaricus* and *Te Deum*, *The Dances of Galánta* and the opera *Háry János* and the sonatas for cello and for unaccompanied cello.

Sibelius, Nielsen and Grieg

Among Scandinavian composers the Finn Jean Sibelius (1865-1957) and the Dane Carl Nielsen (1865-1931) are outstanding. Sibelius is a lone northern figure ploughing his own furrow, oblivious or at any rate ignoring the unusual developments that were taking place in Central Europe yet his seven symphonies are strong as granite, honest, rugged works that will undoubtedly stand the test of time. They are not by any means all similar in mood or even form. The first is very much influenced by Tchaikovsky and Borodin, the second and third show a more personal style, developing the fourth is terse and tragic, the fifth lyrical, bright and lucid, the sixth is perhaps most typically Sibelian in its evocation of primeval nature, and the seventh—in one continuous movement—is a more purely abstract piece notable for its structural logic and the grandness of its themes. The violin concerto is the most easily understood of the composer's main works and has a grateful part for the soloist.

The tone poems *The Swan of Tuonela*, *Pohjola's Daughter*, *En Saga*, *Night Ride* and *Sunrise*, *The Bard* and *Tapiola* uncannily evoke the icy words of the legends of the far north and the primeval

forces of nature. Sibelius's one string quartet *Voces Intimae* and many of his songs are worth hearing too. The quality of this enigmatic composer's music has recently been the subject of much argument but his musical personality is probably strong enough to survive the quirks of fashion.

Carl Nielsen (1865-1931) is another individualist. His six symphonies like Sibelius's seven are the most important part of his output but whereas Sibelius was dealing with a huge uninhabited northern landscape Nielsen is more friendly and serene in his music which is seldom forbidding, always inventive, throwing a new light through unusual ideas about harmony, structure and tonality on traditional forms. He also wrote highly individual concertos for the flute and clarinet, four string quartets and two operas—the dramatic rather Brahmsian *Saul and David* (1902) and a delightful comedy *Maskarade* (1906) full of lyrical music.

The Norwegian composer Edvard Grieg (1843-1907) was essentially a miniaturist whose range of feeling was not wide but whose music is always gentle and appealing. His most notable works are the romantic piano concerto, the atmospheric incidental music to Ibsen's play *Peer Gynt*, the charming *Lyrno Suite* and the small piano pieces. Not an important composer then but always an attractive one.

Elgar and the English Revival.

After the death of Purcell there is hardly a name in English music worth speaking of until the 19th cent when Hubert Parry (1848-1918) and Charles Villiers Stanford (1862-1924) actually an Irishman led a revival. Their music is seldom heard today but their pioneer work paved the way for Edward Elgar (1857-1934). Although all were influenced by Brahms they nevertheless managed to establish a new English tradition that has been carried on in our own day. Elgar's symphonies are laid out on a grand, leisurely scale and they are both eloquent and exhilarating. His violin concerto has an elegiac slow movement as has the glorious cello concerto and both contain many fine opportunities for the soloist. The cello concerto is as appealing a work as any by Elgar, expressing his innermost thoughts. His *Enigma* variations are a series of portraits in sound of his friends but there is another overall theme to go with them that has never been identified. This has not prevented the work from becoming Elgar's most popular nor surprisingly when one considers its charm and melodiousness. Three other orchestral pieces that should not be neglected are his symphonic study *Faeltaf*, a many-sided musical picture of the Fat Knight and the overtures *Cockayne*, a happy evocation of London and *In the South* inspired by a visit to Italy. His three late chamber works written when he was 61 are reluctant economic pieces that remove any misconception of Elgar as a bombastic composer. His songs are mostly feeble but the oratorios notably *The Dream of Gerontius* show the composer's ability to control a large canvas. The composer himself wrote over the score of *Gerontius*. This is the best of me—a verdict with which we can readily agree.

The French Impressionists

César Franck (1822-90) was the main figure in mid 19th cent. musical France and his influence spread even wider than his music of which only the D minor Symphony, the Symphonic Variations for piano and orchestra, the piano quintet and the violin sonata are likely to be encountered today. The leading French opera composers of that time were Massenet (1842-1912) and Gounod (1818-98).

Concurrently with similar movements in French painting and poetry came the French Impressionist composers at the end of the 19th cent. Their leader—and one of the great seminal forces of modern music—was Claude Debussy (1862-1918). His aim was to capture a mood or sensation and he did that by more or less inventing a fresh system

of harmony using a whole tone scale unusual chords and creating in the orchestra new highly personal textures—there is no mistaking the Debussy idiom once you have heard at least one piece by him. His impressionistic style did not lead him however to abandon form as some have suggested and his main works are just as closely organised as those by classical German composers. His music is sensuous and poetic yet nearly always formally satisfying as well.

His reputation at least with the general musical public rests largely on his orchestral music: a few piano pieces and his only opera, *Pelléas et Mélisande*. *La Mer* is a scintillating evocation of the sea in all its moods. *Nocturnes*, *Images* and *Prelude à l'Après-midi d'un Faune* exactly suggest different places, times, moods—the Iberia and Gigue sections of *Images* calling to mind respectively the spirit of Spain and the flickering light of a rainy English night. *Pelléas*, based on a Symbolist drama by Maeterlinck, tells a story of love, jealousy and murder, predominant, yet restrained, yet emotionally loaded terms. It is an elusive original work that has no predecessor or successor. Intensely atmospheric, rivetingly beautiful, it weaves an irresistible spell over the listener.

Debussy's chamber music is unjustly neglected. His string quartet (1893) was one of the first works in which he displayed his new and strange world of sound, and the three late sonatas (one for violin, one for cello, and the third for flute, viola and harp) are elliptical, compressed pieces which seem to be questing disjointedly into new regions of sound. His songs too are worthy of investigation and his piano music, especially the twenty-four Preludes and some of the shorter pieces, contain some of his most imaginative and original ideas and thoughts.

Gabriel Fauré (1845–1924) is a difficult figure to place. He lived through all kinds of musical revolutions yet they seemed to affect the character of his work very little. He has never been and is never likely to be a widely known or popular composer, yet his music has a refinement and delicacy that is very appealing. Despite his dreamy reticence, art he was not a recluse, but a very sociable man.

He was content with forms as he found them, but he imbued them with a very personal human style. Perhaps his art is best heard in his songs. They are not overtly passionate or dramatic but the long sinuous melodies and subtle harmonies are exquisitely wrought. Of the song cycles *La Bonne Chanson*, *Cinq Mélodies* (Verlaine), *Le Chanson d'Eve* and *L'Horizon Chimérique* are best known. The last written in 1922, when the composer was seventy-seven, is a beautiful setting of words by a soldier killed in the first World War. There are also many remarkable single songs, many of them settings of poems by Verlaine.

He wrote few orchestral pieces, but the *Ballade* for piano and orchestra and the *Pavane* are among his most typical and delicate compositions and his outstanding piano music modelled on Chopin's includes *Nocturnes*, *Impromptus* and *Barcarolles*. His chamber music covers more than half a century from the violin sonata of 1876 to the string quartet written the year he died. In that period he composed two piano quartets, two piano quintets, another violin sonata and two cello sonatas, the later works failing to show quite the unforced lyrical grace of the earlier ones. Perhaps Fauré is best approached with the first piano quartet, a charming easily assimilated work and the beautiful choral *Requiem*.

Saint-Saëns (1835–1921), an accomplished cultivated musician, has had a bad press, but his craftsmanship as displayed in his symphonies, concertos and *Samson et Dalila* (one among his 12 operas) is not to be despised.

Henri Duparc (1844–1933), despite a very long life, is known today only for a group of songs he wrote before he was forty. They are among the most emotionally direct yet tasteful melodies ever written. Paul Dukas (1865–1935) is another

figure off the beaten track, as it were. He too is known only for a handful of compositions. He was strongly influenced by Vincent d'Indy (1851–1931) and the school who strongly opposed Debussy's new ideas, yet he could not help but come under Debussy's spell. Dukas's one great work is his opera *Ariane et Barbe Bleue*, the text adapted from a Maeterlinck play written with the composer in mind.

Maurice Ravel (1875–1937), a pupil of Fauré, followed in Debussy's footsteps, although his later pieces were more ascetic. Indeed, he was one of the most fastidious of composers, always seeking and often finding artistic perfection. The works he wrote before 1918 are definitely of the Impressionist School and it would be difficult to imagine more beautiful sounds than are to be found in the ballet *Daphnis et Chloé* or in the song cycle *Shéhérazade* and the piano fantasy *Gaspard de la Nuit*. His first style was summed up in the 4 minor piano trio (1915). In his later music Ravel was struggling not always successfully to keep up with new developments such as jazz and atonality. The piano concerto for instance shows very strongly the influence of jazz.

Outstanding orchestral works of his other than *Daphnis* are *Rapsodie espagnole* (1907), *La Valse* (1920), a sumptuous evocation of the Viennese waltz, and the ever popular *Boléro*. Two chamber works besides the trio are masterpieces—the string quartet (1902–3) and the Introduction and Allegro for Horn, String Quartet, Flute and Clarinet. This Septet composed in 1906 ravishes the senses with magical sound.

Ravel's piano pieces are perhaps his most notable contribution to music, combining an extraordinary feeling for the instrument's technical possibilities with the sensibility of a Chopin and in this field *Jeux d'eau*, *Miroirs*, and *Mà Mère* (1905) all written just after the turn of the century, come very close to the perfection of *Gaspard de la Nuit*. His songs show his unusual appreciation of the need to fuse poetic and musical values and he set exotic poems for preference. The song cycle *Histoires naturelles* (1906) is an acutely observed setting of five poems about birds and animals. *Cinq Mélodies populaires Grecques* (1907) are charming settings of Greek folk songs. *Trois Poèmes de Mallarmé* (1913), *Chansons Mendessées* (1926) are suitably exotic settings of three poems by an 18th cent. Creole poet called Parny. Finally in 1932 came *Don Quichotte à Dulcinée*, three poems by Paul Morand. Ravel's last composition.

Ravel wrote two operas—the slight but moderately amusing *L'Heure espagnole* (1907), nicely orchestrated in a faintly and appropriately Spanish style, and *L'Enfant et les Sortilèges* (1925) to a story by Colette, a delicious fantasy about a naughty child who gets his due punishment for tormenting animals and destroying furniture.

Spain

Felipe Pedrell (1841–1922) has been aptly described as the midwife of Spanish nationalist music. As a musicologist and teacher he strongly influenced the two main composers of the school, Manuel Falla (1876–1946) and Enrique Granados (1867–1916). Falla's output was not large and most of it was written about the time of the first World War. He had spent the years before the war in Paris and there he naturally came under the influence of Debussy. Debussy wrote Spanish music without ever having been to Spain, but so true was it that even to Falla, born and bred in Andalusia, it had new things to say. He was able to take something from Debussy and blend it with his own highly individual style, evoking in his music all the passion and gaiety of his native land. Perhaps his most typical works are the two ballets *Love the Magician* (1915), full of Spanish atmosphere, and *The Three Corners* (1919). The opera *La Vida Breve* (1905), despite its weak libretto, has much appeal, especially when the leading rôle is sung by such a vibrant artist as Victoria de los Angeles. The Seven Popular Spanish Songs (1914) conjure up the vivacity and

smouldering passion at the heart of the country's character as does *Nights in the Garden of Spain* (1916) an evocative piece for piano and orchestra. His later works especially the harpsichord concertos of 1926 show Falla tending towards a less ebullient more neo-classical style. His second opera *Master Peter's Puppet Show* (1923) is a miniaturist work refined and intense. His third opera *Atlántida* left unfinished at his death was completed by his pupil Ernesto Halffter and first staged in 1962. It is a long work more a dramatic cantata than an opera and as such a rather un-wieldy epic.

Granados who was drowned when his ship was torpedoed by the Germans in 1916 was perhaps a more restricted Spanish composer than Falla but his music is unfailingly attractive and surely others of his seven operas besides *Goyescas* (which is heard occasionally) deserve to be rescued from oblivion. *Goyescas* itself is especially famous for the second interlude and opening of Act III—*La Maya y el Ruiseñor* (The lover and the nightingale) a haunting sinuous melody for soprano sometimes heard in its original form as a piano solo. He wrote a set of *Tonadillas*. A *tonadilla* is a type of Spanish song popular in the 18th cent and Granados's set ably and enchantingly recapitulates a lost age of grace and character. His exciting Spanish Dances are heard in both their piano and orchestral form.

The chief claim to fame of Albéniz (1860–1909) is *Iberia* masterly descriptive pieces for piano. Turina (1882–1949) not altogether successfully attempted a more cosmopolitan style but his most often heard music especially that for guitar is typically Spanish.

The Late German Romantics

While composers such as Debussy, Sibelius, Stravinsky and Schoenberg (see below for the latter pair) were striking out along new paths, Richard Strauss (1864–1949) continued in the trend of 19th cent German composers: he was the tradition's last great figure. At least two of his operas—*Salomé* and *Elektra*—were considered shocking at the time but today we can hear that they are essentially big-scale romantic works—natural successors to Wagner—however startling the harmonies may once have seemed.

If Strauss did not achieve the grante intellectual greatness of Beethoven or Wagner, there is no denying his melodic genius and powers of fertile invention which overlaid the streak of vulgarity and inflation in his musical make-up. His first outstanding achievement was in the field of the symphonic poem where he carried the work of composers such as Liszt and Berlioz to its logical conclusion. Starting with *Don Juan* in 1888 and ending with *Sinfonia Domestica* in 1903 he wrote a series of kaleidoscopic works full of enormous vitality, endless melody and fascinating orchestration. The most easily assimilated—and the most popular—are *Don Juan* and *Till Eulenspiegel* but some of the longer works notably *Also Sprach Zarathustra* (based on Nietzsche's prose poem) and *Don Quixote* (based of course on Cervantes's great work) will reward the persistent inquiring mind with long hours of enthralled listening. Other works sound somewhat dated in their bombastic over-confidence though Strauss's skill in composition seldom flagged at this stage of his long creative career. The symphonic poems all tell something of a story usually based on a literary source but it is not essential to the enjoyment of the music to know what this is although it may be helpful.

Strauss's reputation is even more solidly based on his fifteen operas the earliest of which *Güntram* was first performed in 1894 the last *Capriccio* in 1942. During these years the essentials of Strauss's style changed little though it became very much more refined as the years passed. His first operatic period ended with the violent sensuous tragedies *Salomé* (1905) and *Elektra* (1909) the latter being his first collaboration with his chief librettist Hugo von Hofmannsthal. Then came their unique *Der Rosenkavalier* (1911) which

filters the charm and the decadence of 18th cent Vienna through early 20th cent eyes. This was followed by *Aradné auf Naxos* (1912). Originally intended to be given after Molière's *Le Bourgeois gentilhomme* it was later presented (1916) without the play but with a preceding scene written by von Hofmannsthal. *Die Frau ohne Schatten* is the most grandiose result of the Strauss-Hofmannsthal partnership. It is a complex psychological allegory but Strauss's contribution is not on as consistently lofty a level as is his librettist's. *Intermezzo* (1924) which has a libretto by Strauss himself is a largely autobiographical domestic comedy which has lately gained in reputation as a compact charming piece. With *Die ägyptische Helena* (1928) an opera on a mythical theme and *Avabella* (1933) another charming Viennese comedy the Strauss-Hofmannsthal collaboration ended on account of the librettist's death. Strauss then wrote *Die Schweiggende Frau* (1935) to a libretto by Stefan Zweig based on a play by Ben Jonson and *Friedenstag* (1938). *Daphne* (1938)—a beautiful opera—and *Die Liebe der Danae* (written 1938–40) with Josef Gregor as librettist. His swan song was *Capriccio* a dramatisation of the old argument about the relative importance of words and music in opera. The libretto is by the conductor Clemens Krauss and the opera a serene melodious work was a fit end to a great operatic career.

However Strauss went on composing till nearly the end of his life adding a group of late orchestral pieces to his already large catalogue of works. The *Metamorphoses* for 23 solo string instruments is probably the best of these. During his long creative career he wrote numerous songs many of them such as *Morgen*, *Wegenlied* and *Ruhe meine Seele* of surpassing beauty.

Other notable figures in German music at this time were Max Reger (1873–1916) a somewhat ponderous but highly accomplished composer who in a quarter of a century of creative life wrote more than 150 works of which his sets of variations his piano concerto and chamber music are probably the most impressive. Hans Pfitzner (1869–1949) another German traditionalist is chiefly remembered today for his opera *Palestrina* about events now known to be spurious in the life of the 16th cent Italian composer.

Mahler

Gustav Mahler (1860–1911) the Austrian Jewish composer is one of the most important figures in 20th cent music. In a sense he bridges the gulf between the late Romantics who were tending more and more towards chromaticism and away from established key relationships and the atonalists who abandoned key signatures entirely. His detractors maintain that his inflation of allegedly banal Viennese beer-house music to unheard-of lengths rules him out of court as a serious writer. His admirers would claim that his music encompasses the whole of life in enormous valid structures. The truth is that he perhaps lies somewhere in between that if his material does not always justify the length of his symphonies there are occasional imperfections and *longueurs* these shortcomings are worth putting up with for the sake of the depth of utterance the humanity and the poetry of the great pages. He admitted himself that it cannot do without irritations but it is out of these impurities that he forged his titanic victories.

His music is undoubtedly best approached through his songs where the words force him to discipline his wide-ranging vision. *Lieder eines fahrenden Gesellen* (1884) to his own words, *Kinderlieder* (1901–4) to poems by Rückert and some individual songs perfectly relate words to music and are all of a poignant loveliness. Similarly *Das Lied von der Erde* (1908) especially the last of the six songs is a touching farewell to the world nobly expressed.

The ten symphonies however are Mahler's most impressive legacy to posterity. They are almost impossible to characterise briefly so vast are they in terms of both length and variety. The first fourth and ninth are probably the easiest

to grasp but the fifth sixth and seventh despite flaws contain some of his most awe inspiring conceptions. The second and third both of which use soloists and chorus and revolutionary in lay out and concept they both try inevitably with out complete success to carry out the composer's dictum—a symphony should be like the world—it must contain everything. The eighth is even more gargantuan but as in all Mahler's work size does not mean loss of clarity or an overloading of 'the structure'. Part one—a mighty choral invocation—is a visionary setting of the mediaeval hymn *Veni Creator Spiritus*. Part two which incorporates adagio scherzo and finale in one is a setting of the final scene of Goethe's *Faust*. Until recently all of Mahler's unfinished tenth symphony that was ever performed was the Adagio but the musicologist and Mahler scholar Deryck Cooke has recently completed the symphony to critical and popular acclaim and thus added a noble and also optimistic epilogue to the Mahler opus. The debate over the quality of Mahler's music is likely to continue one fact however that cannot be gainsaid is his popularity with an ever increasing audience many of them young people. There must be something in his uncertainty and intense self inquiry that accords with the mood of today.

Schoenberg and the Second Viennese School

Arnold Schoenberg (1874-1951) revolutionised Western music by his twelve note theory—a system which uses all the notes of the chromatic scale and denies the supremacy of a tonal centre as Schoenberg himself puts it. This serial technique of composition as it is commonly called naturally sounds strange to an ear acclimatised to music written as it were, with a home base but Schoenberg and his disciples Berg and Webern showed that the system could produce works that were something more than mere intellectual exercises. None of the more recent advances in music would have been possible even thinkable without Schoenberg's pioneer work.

Schoenberg always regarded himself as much as a composer as a theorist or teacher and his works are supposed to appeal as much to the emotions as to the intellect although to be understood they do of course require the listener's concentrated attention. To appreciate how his ideas developed it is necessary to hear first his pre-tonal music such as the *Gurrelieder* (1900-1) and *Verklärte Nacht* (1899) in which he carried Wagnerian chromaticism to extreme lengths. The *Gurrelieder* in particular is a luxuriant overblown work that shows the Wagnerian idiom in an advanced stage of decay in spite of many beautiful pages of music. In his succeeding works the feeling of tonality began to disappear until in the Three Piano Pieces (opus 11) of 1909 he finally rejected tonality although the new 12 note scheme is not yet evident traces of the old order can still be heard. The succeeding works were mostly short highly compressed and very expressive Schoenberg was reaching out for a new system which would justify the dissonant character of these harmonies and determine their successions. By 1923 he had formulated his 12 note system and the Five Piano Pieces (opus 23) and the Serenade (opus 24) of that year can thus be considered the first works that used a note row as the fundamental basis of their composition. Between 1910 and 1915 however the Russian composer Alexander Scriabin (1872-1915) had attempted to define a new method of composition of his own employing the mystic chord of ascending fourths but his scheme proved comparatively abortive when compared with Schoenberg's. Josef Hauser (1858-1956) also developed a 12 note system which he propounded in 1919 and he always considered himself rather than Schoenberg as the true founder of the system. He later worked out a system of tropes (i.e. half-series of six notes).

To return to Schoenberg in later works he shows much more freedom and assurance in the use of his system. The wind quintet (1924) the variations for orchestra, opus 31 (1927-8) the third (1928) and fourth (1936) string quartets and the

string trio (1946) are modern classics of their kind they require concentrated listening and a degree of understanding of the unfamiliar style of composition. The set of songs with piano *Das Buch der hängenden Gärten* (opus 15) written in 1908 *Pierrot Lunaire* opus 21 (1912) and the Four Songs opus 22 (1913-14) provide a kind of bridge between tonality and atonality that the adventurous mind should cross. The monodrama *Erwartung* (1909) is another fascinating work but perhaps the unfinished *Moses and Aaron* (1932) is Schoenberg's masterpiece as its production at Covent Garden in 1965 showed. Here for certain the composer matched his obvious intellectual capacities with an evident emotional content and managed to combine *Sprechgesang* (speech song) and singing with a real degree of success.

It is only in recent years that Schoenberg's music has had a real chance to make its mark through the essential prerequisite of frequent performance. If his idiom now seems approachable and a reasonably natural outcome of late 19th cent developments it is perhaps because there more recent composers have extended the boundaries of sound much further.

Schoenberg's two most respected disciples were Anton Webern (1883-1945) and Alban Berg (1885-1935). Webern's output is small reaching only to opus 31 and many of his works are very brief. They are exquisitely precise and delicate almost to a fault. He was trying to distil the essence of each note and in so doing carried the 12 note system to its most extreme and cerebral limit. His music has often been described as pointillist in the sense that one note is entirely separated from the next there being little discernible melody. Beyond Webern's music there is indeed the sound of nothingness and he was rightly described during his lifetime as the composer of the *puanissimo espressivo*. In his later works Webern tended towards a strict and often in generous use of form and the Variations for Orchestra of 1940 are a good example of this and of his delicacy of orchestration. Webern's influence has perhaps been greater than the impact of his own music even though he has had no direct successor.

Berg's music is much more accessible. Like Webern his total output was not large but nearly all his works are substantial additions to the repertoire. He is also the directest link between Mahler and the second Viennese School as Mahler's music influenced him strongly. He studied with Schoenberg from 1904 to 1910. His music is more intense more lyrical and less attenuated in sound than Schoenberg's or Webern's. His humanity and abiding compassion can be heard most strongly in his finest opera *Wozzeck* (1925) and his violin concerto (1935) written as an elegy on the death of Manon Gropius a beautiful 18 year old girl. Both works are very carefully designed yet formal considerations are never allowed to submerge feeling and the note row is fully integrated into the structure.

Both *Wozzeck* and the unfinished but rewarding *Lulu* are concerned with society's outcasts who are treated with great tenderness in both operas. The latter work is entirely dodecaphonic all the opera's episodes being based on a theme associated with Lulu. Between these operas Berg wrote the highly complex Chamber Concerto for piano violin, and thirteen wind instruments (1925) and the expressive Lyric Suite (1926). Among his early works the Seven Early Songs (1905-9) and the concert aria *Der Wein* (1920) are notable.

Stravinsky

Igor Stravinsky (b 1882) is another vital figure in 20th-cent music. If his influence has been in quite another and perhaps less drastic direction than Schoenberg's it is hardly less important. Indeed future musical historians may consider his achievement the more significant. He has been compared with the painter Picasso in his almost hectic desire to keep up with the times yet although he has written in a number of very different styles during the past fifty years every work of his is stamped with his own definitive

musical personality. His most revolutionary and seminal work is undoubtedly *The Rite of Spring* (written for the ballet impresario Diaghilev) which caused a furore when it first appeared in 1913 and although it no longer shocks the rhythmical energy, the fierce angular thematic material and the sheer virtuosity of the orchestration will always have the power to excite new audiences. Before *The Rite* Stravinsky had written two ballets for Diaghilev—*The Firebird* and *Petrushka*—that are no less filled with vitality and new albeit not so violent sounds. During the next thirty years Stravinsky wrote a series of ballet works gradually becoming more austere and refined in composition. *Apollo* (1928) and *Orpheus* (1947) belong among his most attractive scores.

Stravinsky has not confined himself in stage works to the ballet. *The Nightingale* (1914) is a charming early opera. *The Soldier's Tale* (1918) is a witty combination of narration, mime and dance. *Les Noces* (1923) is a concise original choreographic cantata for soloists and chorus. *Oedipus Rex* (1927) is a dignified version of the Sophocles play which can be staged or given on the concert platform either way it is a moving experience. *Persephone* (1934) a melodrama for reciter, tenor, chorus and orchestra is an appealing lucid score. Since the war his most important stage work by far has been *The Rake's Progress* (1951) with a libretto by W. H. Auden and Chester Kallman. This fascinating opera is deliberately based on 18th cent. forms and the music itself is neo-classical, always attractive, sometimes haunting.

Stravinsky has been no laggard in writing for the concert platform either. The finest of these works are probably the fervent impressive choral *Symphony of Psalms* (1930), the Violin Concerto (1931) and the aggressive compact *Symphony* in three movements (1945). Of his chamber music the Octet (1923), a Duo Concertant (1932) and Septet (1952) are probably the most important, but no piece, even the driest and most pedantic is without redeeming features.

Stravinsky is often thought of as an aloof detached figure. He has been castigated for his lack of lyrical warmth. But in spite of his own professed desire to drain his music of specific emotion, craftsmanship and originality often with a strange otherworldly beauty added are unmistakably there throughout his many scores. Quirky and annoying he may be, dull never.

Busoni and Puccini

Italian music in the early part of the century was dominated by two very different composers—Ferruccio Busoni (1866-1924) and Giacomo Puccini (1858-1924). Busoni is a difficult figure to place. His austere intellectual power is never called in question but he seldom if ever succeeded in translating his technical prowess into altogether successful compositions. We can admire the strength, honesty and often beauty of such works as his huge piano concerto (1903-4) *Fantasia Contrappuntistica* (1912)—for piano solo—and his unfinished opera *Doktor Faust* without ever capitulating to them entirely. None the less it has to be admitted that those who have studied his music closely have always fallen completely under his spell. In style his music is anti-Romantic and often neo-Classical yet he was an ardent admirer of Liszt and more especially of Liszt's realisation of the possibilities of the pianoforte. Busoni himself a great pianist, carried on where Liszt had left off in his own piano music in which form and expression often find their perfect balance. *Doktor Faust* is undoubtedly his most important opera but *Die Bräutigam* (1908-10) and *Turandot* (1917) have many points of interest too.

Puccini's *Turandot*—his last opera—is a much grander version of the same Gozzi fable and the culmination of this great opera composer's work. His achievement is at an almost directly opposite pole to Busoni's. Not for him the severity or intellectuality of his contemporary. He sought and found an almost ideal fusion of straight forward lyricism and dramatic truth. His music

unerringly follows the pathos and passion of the stories he sets and all his characters live as human beings. That and his abundant flow of easy soaring melody are the reasons for his immense popular success unequalled by any other 20th cent. composer. Whether it is the pathetic Mimì (*La Bohème*—1896) and Cio Cio San (*Madama Butterfly*—1904) the evil Scarpia (*Tosca*—1900) the cunning Schiuchì (*Gianani Schiuchì*—1918) the ardent Poldofo (*La Bohème*) and Cavardossi (*Tosca*) or the ice cold Turandot (*Turandot*—1926). Puccini's musical characterisation is unfailing. And he backs his *verismo* vocal writing with an orchestral tissue that faithfully reflects the milieu of each opera, for instance Japanese for *Butterfly*, Chinese for *Turandot* while never losing his particular brand of Italian warmth. His orchestration is always subtle and luminous.

Other Italian composers who wrote operas in the *verismo* style of Puccini were Leoncavallo (1858-1919), Mascagni (1863-1945) and Giordano (1867-1948).

Prokofiev, Shostakovich and Rachmaninov

Sergey Prokofiev (1891-1953) spent part of his creative life in his native Russia, part of it (1918-34) abroad, mostly in Paris. His early music apart from the popular Classical Symphony (1916-17) tended to be acid and harsh but on his return to Russia his style though still frequently satirical became warmer, more Romantic. The third piano concerto (1917) and the second symphony (1924) are good examples of the former period, the ballets *Romeo and Juliet* (1935) and *Cinderella* (1941-44) and the fifth (1944) and sixth (1949) symphonies of the latter. His music gives the impression of immense rhythmical energy as in the outer movements of several of his nine piano sonatas, but this fierce drive is often leavened by the soft, wistful lights of his slow movements. His second string quartet (1941), perhaps presents all the elements of his music in the kindest light.

His strong leaning towards fantasy and mordant parody is felt in his earlier operas *The Love of the Three Oranges* (1921) and *The Fiery Angel* (1922-25). *War and Peace* (1941-42) was written in the face of strong pressure from the Soviet authorities.

Dmitri Shostakovich (b. 1906) has also suffered from attacks of formalism. He had to conform to Stalin's requirements for writing music but he has survived and continues to produce music of universal appeal as for example his most recent string quartets. Like Prokofiev his music falls into two very distinct styles, one humorous and spiky, the other intense, very personal and often large scale in its implications. Not all his symphonies reach the expressive depths of numbers one, five, six and eight but they all have rewarding passages and his recent violin and cello concertos are of high quality. He has so far written eleven string quartets, a piano quintet (an attractive piece) and two operas, the satirical *The Nose* (1930) and *Katerina Ismailova* (1934, revised 1959), originally known as *Lady Macbeth of Mtsensk*. The first performance (outside Russia) of his fourteenth symphony was to be heard at the Aldeburgh festival in 1970.

Although Sergey Rachmaninov (1873-1943) was born in Russia, he left his home country in 1918, disliking the Soviet régime and lived mostly in Switzerland and the United States. His music is chiefly notable for its Romanticism, nostalgic melody, nervous energy and in the piano works its opportunities for displays of virtuosity. The first three piano concertos, the third symphony, the piano preludes and the Rhapsody on a theme of Paganini are his most typical and attractive works and many of his songs are touching and beautiful. He wrote three operas.

Modern French Music

French music after Debussy and Poulenc was dominated by the slightest composers known as *Les Six*, the most important of whom were Arthur

Honegger (1892-1955 Swiss born) Darius Milhaud (b 1892) and Francis Poulenc (1898-1963). Each has contributed music of some wit and charm to the repertory. They were influenced by Erik Satie (1866-1925) an eccentric but interesting figure who wrote works with odd titles such as *Three Pear Shaped Pieces*. His music is entirely unsentimental often ironic.

Much more revolutionary has been the work of Olivier Messiaen (b 1908) who has turned to Indian music and above all to bird song for inspiration. He first came to notice as a composer of organ music. Then his *Quatuor pour la fin de temps* written in captivity between 1940 and 1942 his long piano pieces based on bird song (often literally) and his gigantic *Turangbala* symphony show him experimenting with complex rhythms strange sonorities (using unusual instruments such as the Ondes Martenot in the symphony) and considerably widening music's horizons. Edgar Varèse (1883-1965) cultivated an even broader spectrum of sound employing electronic instruments to complement and contrast with traditional ones. Pierre Boulez (b 1925) a pupil of Messiaen bases his extremely complex works on mathematical relationships. His music other than that for the piano mostly calls for a variety of percussion instruments often combined with the soprano voice in evocations of French poetry (Mallarmé in particular). The resulting timbre and sonorities are intriguing even when the intellectual basis of the music is but dimly perceived.

Modern German Music

Kurt Weill (1900-50) is chiefly known for his socio-politically pointed operas such as *Die Dreigroschenoper* (1928) *Mahagonny* (1929) *Der Jasager* (1930) and *Happy End* (1929) all effective works on the stage and for his particular brand of brittle yet fundamentally romantic music. His influence on later composers has been considerable.

Carl Orff (b 1895) has written chiefly for the stage. His music is rhythmically insistent avoids counterpoint and is deliberately even self consciously straightforward. Most frequently heard is his *Carmina Burana* lively rumbustious choral settings of medieval poems.

Paul Hindemith (1895-1964) in his later years wrote in a strictly tonal often neo classical idiom after being one of the most advanced intellectuals of his time. As well as many chamber and orchestral works he wrote three formidable operas: *Die Harmonie der Welt* *Cardillac* and *Mathis der Maler*.

Karlheinz Stockhausen (b 1928) a pupil of Messiaen is another extreme innovator. He more than anyone puts electronics to musical use. His scores are a maze of diagrams and instructions, which really need the composer's presence for their true interpretation. It is too early to say whether his music is evidence of a passing vogue or a real step forward in musical ideas.

Hans Werner Henze (b 1926) has rebelled against the musical climate in Germany and now lives in Italy yet his music combines the intellectuality of the modern German schools with the lyricism of Italian music. He has written five symphonies though none follow the traditional form and nine operas, among them two impressive large-scale works: *Edgar Hirsch* (1952-55) and *The Bassarids* (1966) to an Arden Kallman libretto.

American Music.

It was not until the 20th cent that American music really got under way and an American school came into being. With the possible exception of MacDowell (1861-1908) no earlier composers are remembered or played today. Many composers of the American school have of course taken their cue from Europe but the influence of American jazz and folk song is also recognisable in some of their music. Aaron Copland (b 1890) is probably the most important figure on the

current scene and such works as *Appalachian Spring* *Billy the Kid* and his third symphony have gained a certain amount of international recognition and popularity. Samuel Barber (b 1910) works along traditional lines and his music like Copland's is essentially diatonic. He has contributed to all the usual forms (symphony concerto sonata) most recently to opera with *Vanessa* (1958) and *Antony and Cleopatra* (1966) which opened the new Metropolitan Opera House in New York's Lincoln Centre. Roy Harris (b 1898) has written seven symphonies and several concertos which include folk elements.

Charles Ives (1874-1954) has recently been recognised as the most original American composer. While carrying on a highly successful career in insurance Ives yet managed to anticipate in his works all written before 1920 many of the innovations which were later invented in Europe. His orchestral music is much influenced by the sounds of his brass bands which he heard in his native New England as a boy. His *Three Places in New England* and *The Unanswered Question* have a beautiful elusive quality about them. In his five symphonies and *Concord* sonata we notice the working of an original mind employing polytonality and polyrhythms in larger and more complex works. An element of improvisation is sometimes introduced another anticipation of latter day technique. Ives is unlikely ever to become a popular composer—his music is too complicated and eclectic for that—but his importance as a prophet is surely established.

Modern English School

The amazing 20th cent revival of music in England owes much to Ralph Vaughan Williams (1872-1958) and Gustav Holst (1874-1934). Vaughan Williams's music is today suffering a decline in reputation but the best of his symphonies (one four five and six) his *Fantasia* on a theme by Tallis his ballet *Job* and the best of his choral music have a sturdiness about them that will no doubt weather the whim of passing fashion. His music alternates between the forceful and the contemplative and both moods are expressed in a distinctive musical vocabulary based on modality and 16th cent polyphony.

Holst was a more enigmatic figure but his influence has undoubtedly been greater. Only his suite *The Planets* and the choral *The Hymn of Jesus* have established themselves as repertory works but his bold harmonic experiments and the austerity even mysticism of his style as heard in the orchestral pieces *Edgdon Heath* *Bene Mora* and the opera *Savitr* are perhaps more typical of this contemplative original composer. His daughter Imogen a conductor has done much to promote understanding of her father's music. Contemporaries who deserve much more than a passing reference are John Ireland (1879-1962) and Sir Arnold Bax (1883-1968).

Frederick Delius (1862-1934) was the only important English disciple of the French Impressionist school. He lived in France from 1888 onwards. His most important works are the atmospheric tone poems for orchestra such as *Brigg Fair* the vocal and orchestral *A Mass of Life Sea Drift* and *Appalachia* and the opera *A Village Romeo and Juliet*.

Of the more recent generation of English composers the most important are undoubtedly Benjamin Britten (b 1913) Sir Michael Tippett (b 1905) Alan Rawsthorne (b 1905) and Sir William Walton (b 1902). Britten has done more than anyone to establish English music on the forefront of the international stage. Much of his music seems to have an immediate appeal to large audiences and certainly his many stage works have earned him a quite exceptional prestige both at home and abroad. *Peter Grimes* (1945) *Billy Budd* (1951) *Gloriana* (1953) *A Midsummer Night's Dream* (1960) all in their very different ways show his consummate mastery of stage technique and the first two are also moving human documents. On a smaller scale he has achieved as much with his chamber operas—*The Rape of Lucretia* (1946) *Albert Herring* (1947)

and *The Turn of the Screw* (1954 based on a Henry James novel)—and with the two recent Parables for Church Performance—*Curlew River* (1964) and *The Burning of the Witches* (1966). If he had written nothing else these dramatic works would have marked him out as a composer of outstanding imaginative gifts.

But there is more—the choral works culminating in the *War Requiem* (1962) his various song cycles written for the tenor Peter Pears the *Serenade* for tenor horn and string *Nocturne* for tenor and orchestra the three *Canticles* and the *Spring Symphony* are further evidence—in very different media—of both his intense emotional commitment and his technical skill. While being strongly influenced by such composers as Schubert, Verdi, Mahler and Berg, his style is entirely his own: it is a musical personality that manages to combine as it has been said, a deep nostalgia for the innocence of childhood a mercurial sense of humour and a passionate sympathy with the victims of prejudice and misunderstanding.

This last quality is particularly evident also in Tippett's emotional makeup as expressed in his music especially in one of his earliest successes the choral work *A Child of Our Time* (1941) which shows both his compassion and his ability to write on a large scale. But Tippett is as much a mystic and searcher as a composer and he is constantly seeking new and different ways of widening his listeners' horizons as may be heard in the exceedingly complex *Vision of St Augustine* (1965) which tellingly sets to music the striving to understand the beyond of Augustine's words.

Tippett has also sought new means of musical expression as he has shown in his second opera *Kings Cross* (1962) very spare and pointed in idiom and in the concerto for orchestra (1962). These works as well as his piano concerto (1956) and second symphony—a luminous work—and his three string quartets are very difficult to perform—and to get to know—but the effort to understand the composer's wide spanning mind is always richly rewarded. However perhaps a newcomer to his music does better to approach him through the more straightforward earlier works: the concerto for double string orchestra (1939) the *Fantasia Concertante* on a theme of Corelli (1953)—a lyrically poetic piece—or the song cycles *Boyhood's End* (1943) and *Hearts Assurance* (1957). The quality of his allegorical opera *The Midsummer Marriage* (1952) in spite of its involved libretto (by the composer) is now better appreciated since its revival at Covent Garden. *The Knot Garden* also concerned with the inner life of the spirit and the external world was first performed at Covent Garden in 1970. Tippett is an uncompromising individualist writing without fear or favour perhaps considerably in advance of his time in thought and achievement.

Rawsthorne's style is admirably direct and honest. Eschewing the latest fashions in music

he has ploughed his own furrow of deeply felt writing. His ideas are argued out with considerable lyrical force and his astute regard for form does not hide the underlying emotional content of his music nor the touch of wit that pervades some of his more lively movements. Among his most important accomplishments to date are his three string quartets violin concerto two piano concertos and the quintet for piano and wind instruments.

Walton's outstanding contribution was made before the second World War in music that was alternately gay and romantic. The irreverent *Façade* (1923) for speaker and chamber orchestra falls into the former category; the poetic violin concerto (1928) into the second. His first symphony (1934-5) is an arresting dramatic score and the oratorio *Belshazzar's Feast* (1931) is a landmark in choral music. Since the war his works have never quite recaptured the same urgency of expression.

Elisabeth Lutyens (b. 1906) is Britain's leading twelve-note composer. For long shunned by the musical establishment she has now been accepted as an important and seminal figure in the history of 20th-century music. Her output has been large and includes numerous works for unusual small groups of instruments often combined with a solo voice. Benjamin Frankel (b. 1906) Edmund Rubbra (b. 1901) Sir Arthur Bliss (b. 1891) and Lennox Berkeley (b. 1903) are other composers of note among the senior school of living British composers. Egon Wellesz (b. 1885) Austrian born settled in this country in 1939. He has written operas choral works symphonies and chamber music and is still active. There is a thriving junior school of British composers who have already made their mark among them: Alexander Goehr, Richard Rodney Bennett, Malcolm Williamson and Nicholas Maw each of whom has written one or more operas.

Where Does the Future Lie?

It is anybody's guess which way music will develop during the next few decades. Are older forms quite outmoded as some recent innovators suggest and does the future therefore lie with the electronic music and/or percussive sounds—à la Boulez Stockhausen Luigi Nono (b. 1924) and their disciples? Or will what has been recognised as musical sound for several generations adapt itself to the new mood abroad? Has atonalism still something to offer or was it a passing phase already dated and out of fashion? Perhaps the only answer that can be given with certainty is that as with other centuries a dozen or so composers' music will survive to delight later generations and that these geniuses will be found among composers who do and say what they must in music without regard to fashion patronage or fear of what anyone writes about them. May they be worthy of their rich heritage.

II GLOSSARY OF MUSICAL TERMS

A Note of scale commonly used for tuning instruments.
Absolute Music Music without any literary descriptive or other kind of reference.
A Capella Literally in the church style. Unaccompanied.
Accelerando Quickening of the pace.
Accidental The sign which alters a note by a semitone: \sharp (sharp) raises it \flat (flat) lowers it \natural restores a note to its original position.
Accompaniment Instrumental or piano part forming background to a solo voice or instrument that has the melody.
Ad lib (L. *ad libitum*) Direction on music that strict time need not be observed.
Adagio A slow movement or piece.
Aeolian mode One of the scales in medieval music represented by the white keys of the piano from A to A.

Air A simple tune for voice or instrument.
Alberti bass Rhythmical accompanying figure made up by splitting a chord. Used extensively in 18th-century music and associated with the Italian composer Alberti.
Allegretto Not quite so fast as *Allegro*.
Allegro Fast but not too fast.
Alto An unusually high type of male voice also the vocal part sung by women and boys with a low range.
Ambrosian Chant Plainsong introduced into church music by St Ambrose, bishop of Milan (d. 397) and differing from Gregorian chant.
Andante At a walking pace not so slow as *Adagio* nor as fast as *Allegretto*.
Animato Lively.
Answer Second entry in a fugue usually in the dominant.

Anthem Composition for use in church during a service by a choir with or without soloists

Antiphonal Using groups of instruments or singers placed apart

Appoggiatura An ornament consisting of a short note just above or below a note forming part of a chord

Arabesque Usually a short piece highly decorated

Arco Direction for string instruments to play with bow

Aria Vocal solo usually in opera or oratorio often in three sections with the third part being a repeat of the first. An *Arietta* is a shorter lighter kind of aria

Arioso In the style of an aria halfway between aria and recitative

Arpeggio Notes of a chord played in a broken spread out manner as on a harp

Ars antiqua The old medieval music based on organum and plainsong before the introduction of *Ars nova* in 14th cent.

Ars nova Musical style current from 14th cent. more independent than the old style in the part writing and harmony

Atonal Not in any key hence *Atonality*

Aubade Morning song

Augmentation The lengthening of a melody by lengthening the musical value of its notes

Avre Old spelling of *air*

B Note of scale represented in Germany by *H*

Bagatelle A short generally light piece of music. Beethoven wrote 26 Baguettes

Ballad Either a narrative song or an 18th cent. drawing room song

Ballade Instrumental piece in story telling manner. Chopin wrote 4

Ballt Stage entertainment requiring instrumental accompaniment originated at French court in 16th and 17th cent.

Bar A metrical division of music the perpendicular line in musical notation to indicate this

Barcarolle A boating song in particular one associated with Venetian gondoliers

Bartone A male voice between tenor and bass

Baroque A term applied loosely to music written in the 17th and 18th cent. roughly corresponding to baroque in architecture

Bass The lowest male voice lowest part of a composition

Bass Drum Largest of the drum family placed upright and struck on the side

Bassoon The lowest of the woodwind instruments uses double reed

Beat Music's rhythmic pulse

Bel canto Literally beautiful singing—in the old Italian style with pure tone and exact phrasing

Berceuse Cradle song

Binary A piece in two sections is said to be binary in form. The balance is obtained by a second phrase (or section) answering the first

Bitonality Use of two keys at once

Bow Stick with horsehair stretched across it for playing string instruments

Brass Used as a collective noun for all brass or metal instruments

Breve Note rarely used nowadays, with tone value of two semibreves

Bridge Wood support over which strings are stretched on a violin cello guitar etc

Buffo(a) Comic as in *buffo bass* or *opera buffa*

C Note of scale

Cabaletta Final, quick section of an aria or duet

Cadence A closing phrase of a composition or a passage coming to rest on tonic (key note)

Cadenza Solo vocal or instrumental passage either written or improvised. Giving soloist chance to display technical skill to audience

Colando Becoming quieter and slower

Canon Device in contrapuntal composition whereby a melody is introduced by one voice or instrument then repeated by one or more voices or instruments either at the same pitch (canon at the unison) or at different intervals (canon at the fifth for example)

Cantabile Song like therefore flowing and expressive

Cantata Vocal work for chorus and/or choir

Cantilena Sustained smooth melodic line

Cantus firmus Literally fixed song. Basic melody from 14th to 17th cent. around which other voices were contrapuntal parts

Canzonet Light songs written in England c 1600

Carillon A set of bells in tower of church played from a keyboard below

Carol Christmas song

Castrato Artificially created male soprano and alto fashionable in 17th and 18th cent. (The castration of vocally gifted boys prevailed in Italy until the 19th cent.)

Catch A part song like a round in vogue in England from 16th to 19th cent.

Cavatina An operatic song in one section or a slow song like instrumental movement

Celesta Keyboard instrument with metal bars struck by hammers

Cello Four stringed instrument played with bow with a bass range. Comes between viola and double bass in string family

Cembalo Originally the Italian name for the dulcimer but sometimes applied to the harpsichord

Chaconne Vocal or instrumental piece with unvaried bass

Chamber Music Music originally intended to be played in a room for three or more players

Chanson Type of part song current in France from 14th to 16th cent.

Chant Singing of psalms masses etc in plain song to Latin words in church

Choir Body of singers used either in church or at concerts

Chorales German hymn tunes often made use of by Bach

Chord Any combination of notes heard together. See also Triad

Chording Spacing of intervals in a chord

Chorus Substantial body of singers usually singing in four parts

Chromatic Using a scale of nothing but semi-tones

Clarinet Woodwind instrument with single reed in use since mid 18th cent.

Clavichord Keyboard instrument having strings struck by metal tangents much in use during 17th and 18th cent. as solo instrument

Clavier Used in German (*Klavier*) for piano in England for any stringed keyboard instrument

Clef Sign in stave that fixes place of each note

Coda Closing section of movement in Sonata form

Coloratura Term to denote florid singing

Common chord See Triad.

Common Time Four crotchets to the bar 4/4 time

Compass Range of notes covered by voice or instruments

Composition Piece of music, originated by a composer's own imagination act of writing such a piece

Compound time Any musical metric not in simple time

Con Brio With dash

Concert Public performance of any music

Concertato Writing for several solo instruments to be played together

Concerto Work for one or more solo instruments and orchestra

Concerto grosso Orchestral work common in 17th and 18th cent with prominent parts for small groups of instruments

Concord Opposite of discord *i.e.* notes that when sounded together satisfy the ear (Conventional term in that its application varies according to the age in which one lives)

Conduct To direct a concert with a baton

Consecutive like kind Progression of harmonic intervals of like kind

Consonance Like Concord

Continuo Bass line used in 17th and 18th cent music for a keyboard instrument requiring special skill from performer

Contralto A woman's voice with a low range

Counterpoint Simultaneous combination of two or more melodies to create a satisfying musical texture Where one melody is added to another one is called the other's counterpoint The adjective of counterpoint is contrapuntal

Counter tenor Another name for male alto

Covante A dance in triple time

Crescendo Getting louder

Crook Detachable section of tubing on brass instruments that change the tuning

Crotchet Note that equals two quavers in time value

Cycle Set of works especially songs intended to be sung as group

Cyclic form Form of work in two or more movements in which the same musical themes recur

Cymbal Percussion instrument two plates struck against each other

D Note of scale

Da Capo (abbr. D.C.) A *Da Capo* aria is one in which the whole first section is repeated after a contrasting middle section

Descant Additional part (sometimes improvised) sung against a melody

Development Working out section of movement in sonata form *See* Sonata

Diatonic Opposite of chromatic using proper notes of a major or minor scale

Diminished Lessened version of perfect interval e.g. semitone less than a perfect fifth is a diminished fifth

Diminuendo Lessening

Diminution Reducing a phrase of melody by shortening time value of notes

Discord Opposite of concord *i.e.* notes that sounded together produce a clash of harmonies

Dissonance Like discord.

Divertimento A piece usually orchestral in several movements like a suite

Dodecaphonic Pertaining to 12 note method of composition

Dominant Fifth note of major or minor scale above tonic (key) note

Dorian Mode One of the scales in medieval music represented by the white keys on the piano from D to D

Dot Placed over note indicates staccato placed after note indicates time value to be increased by half

Double bar Two upright lines marking the end of a composition or a section of it

Double bass Largest and lowest instrument of violin family played with bow

Drone bass Unvarying sustained bass similar to the permanent bass note of a bagpipe

Drum Variety of percussion instruments on which sound is produced by hitting a skin stretched tightly over a hollow cylinder or hemisphere

Duet Combination of two performers composition for such a combination

Duple time Time in which main division is two or four

Dynamics Gradations of loudness or softness in music

E Note of scale

Electronic Term used to describe use of electronic sounds in music

Encore Request from audience for repeat of work or extra item in a programme

English horn (Cor anglais) Woodwind instrument with double reed of oboe family

Enharmonic Modulation made by means of change of note between sharps and flats although note remains the same (F flat becomes D sharp for example)

Ensemble Teamwork in performance item in opera for several singers with or without chorus a group of performers of no fixed number

Episode Section in composition usually divorced from main argument

Exposition Setting out of thematic material in a sonata form composition

Expression marks Indication by composer of how he wants his music performed

F Note of scale

False relation A clash of harmony produced when two notes such as A natural and A flat are played simultaneously or immediately following one another

Falsetto The kind of singing by male voices above normal register and sounding like an unbroken voice

Fanfare Flourish of trumpets

Fantasy A piece suggesting free play of composer's imagination or a piece based on known tunes (folk operatic etc.)

Fermata Pause indicated by sign () prolonging note beyond its normal length.

Fifth Interval taking five steps in the scale A perfect fifth (say C to G) includes three whole tones and a semitone a diminished fifth is a semitone less an augmented fifth a semitone more

Figure A short phrase especially one that is repeated

Fingering Use of fingers to play instrument or the indication above notes to show what fingers should be used

Flat Term indicating a lowering of pitch by a semitone or to describe a performer playing under the note

Floral Term used to describe decorative passages

Flute Woodwind instrument blown sideways It is played through a hole not a reed Nowa days sometimes made of metal

Folksong Traditional tune often in different versions handed down orally from generation to generation

Form Course or layout of a composition especially when in various sections

Fourth Interval taking four steps in scale A perfect fourth (say C to F) includes two whole tones and a semitone If either note is sharpened or flattened the result is an augmented or a diminished fourth

Fugato In the manner of a fugue

Fugue Contrapuntal composition for various parts based on one or more subjects treated imitatively but not strictly

G Note of scale

Galant Used to designate elegant style of 18th cent music

Galliard Lively dance dating back to 15th cent or before

- Gavotte** Dance in 4/4 time beginning on third beat in bar
- Gusto** Strict proper
- Glee** Short part song
- Glissando** Rapid sliding scales up and down piano or other instruments
- Glockenspiel** Percussion instrument consisting of tuned steel bars and played with two hammers or keyboard
- Grace note** See Ornament
- Grave** In slow tempo
- Grazioso** Gracefully
- Gregorian Chant** Plain-song collected and supervised mainly by Pope Gregory (d. 604)
- Ground bass** Figure on theme used as bass in a composition and constantly repeated without change
- Guitar** Plucked string instrument of Spanish origin having six strings of three octave compass
- H** German note symbol for *B*
- Harmony** Simultaneous sounding of notes so as to make musical sense
- Harp** Plucked string instrument of ancient origin the strings stretched parallel across its frame. The basic scale of C flat major is altered by a set of pedals
- Harpsichord** Keyboard stringed instrument played by means of keyboard similar to a piano but producing its notes by a plucking rather than a striking action
- Homophonic** Opposite of polyphonic i.e. in indicated parts move together in a composition a single melody being accompanied by block chords as distinct from the contrapuntal movement of different melodies
- Horn** Brass instrument with coiled tubes. Valves introduced in 19th cent. made full chromatic use of instrument possible
- Hymn** Song of praise especially in church
- Imitation** Repetition, exactly or at least recognisably of a previously heard figure
- Impromptu** A short seemingly improvised piece of music especially by Schubert or Chopin
- Improviser** To perform according to fancy or imagination sometimes on a given theme
- In all** The octave above the treble clef *in altissimo* octave above that
- Instrumentation** Writing music for particular instruments using the composer's knowledge of what sounds well on different instruments
- Interlude** Piece played between two sections of a composition
- Intermezzo** Formerly meant interlude now often used for pieces played between acts of operas
- Interval** Distance in pitch between notes
- Ionian mode** One of the scales in medieval music represented on piano by white keys between C and C identical therefore to modern C major scale
- Isohythmic** Term applied to motets of 14th and 15th cent. where rhythm remains strict although melody changes
- Jig** Old dance usually in 6/8 or 12/8 time
- Kettledrum** (It. pl. *Timpani*) Drum with skin drawn over a cauldron shaped receptacle can be tuned to definite pitch by turning handles on rim thus tightening or relaxing skin
- Key** Lever by means of which piano organ etc. produces note classification in relatively modern times of notes of a scale. Any piece of music in major or minor is in the *key* of its tonic or keynote
- Keyboard** Term used to describe instruments with a continuous row of keys
- Key signature** Indication on written music usually at the beginning of each line of the number of flats or sharps in the key of a composition
- Kitchen Department** Humorous term for percussion section of an orchestra
- Lament** Musical piece of sad or deathly significance
- Largamente** Spaciously
- Largo** Slow
- Leading-motive** (Ger. *Leitmotiv*) Short theme suggesting person idea or image quoted throughout composition to indicate that person etc.
- Legato** In a smooth style (of performance etc.)
- Lento** Slow
- Libretto** Text of an opera
- Lied** (pl. *Lieder*) Song with special reference to songs by Schubert Schumann Brahms and Wolf
- Lute** String instrument plucked with fingers used in 15th and 16th cent. music especially
- Lydian mode** One of the scales in medieval music represented by white keys of piano between F and F
- Lyre** Ancient Greek plucked string instrument
- Madrigal** Contrapuntal composition for several voices especially prominent from 15th to 17th cent.
- Maestoso** Stately
- Major** One of the two main scales of the tonal system with semitones between the third and fourth and the seventh and eighth notes identical with 18th cent. Ionian mode
- Mandolin(e)** Plucked string instrument of Italian origin
- Manual** A keyboard for the hands used mostly in connection with the organ
- Master of the King's (or Queen's) Music** Title of British court appointment with no precise duties
- Melisma** Group of notes sung to a single syllable
- Mélodie** Literally a melody or tune has come to mean a French song (cf. German *Lied*)
- Metronome** Small machine in use since the beginning of the 18th cent. to determine the pace of any composition by the beats of the music e.g. $\text{♩} = 60$ at the head of the music indicates sixty crotchets to the minute
- Mezzo Mezza** (It. = half) *Mezza voce* means using the half voice (a tone between normal singing and whispering) *Mezzo soprano* voice between soprano and contralto
- Mum** Note that equals two crotchets in time value
- Minor** One of the two main scales of the tonal system (cf. major) identical with 16th cent. Aeolian mode. It has two forms—the harmonic and melodic the former having a sharpened seventh note the latter having the sixth and seventh notes sharpened
- Musuet** Originally French 18th cent. dance in triple time then the usual third movement in symphonic form (with a contrasting trio section) until succeeded by scherzo
- Mixolydian mode** One of the medieval scales represented by the white keys on the piano from G to G
- Modes** Scales prevalent in the Middle Ages. See Aeolian Dorian Ionian Lydian Mixolydian Phrygian
- Modulate** Changing from key to key in a composition not directly but according to musical "grammar"
- Molto** Much very thus *allegro molto*
- Motet** Sacred, polyphonic vocal composition. More loosely any choral composition for use in church but not set to words of the liturgy
- Motivic motif** Short easily recognised melodic figure

Motto Short well defined theme recurring throughout a composition of *Idees fixes* in Berlioz's *Symphonie Fantastique*

Movement Separate sections of a large scale composition each in its own form

Music drama Term used to describe Wagner's and sometimes other large scale operas

Mutes Devices used to damp the sound of various instruments

Natural (of a note or key) Not sharp or flat

Neo classical Term used to describe music written mostly during the 1920s and 30s in the style of Bach or Mozart

Ninth Interval taking nine steps e.g. from C upwards an octave and a whole tone to D

Nocturne Literally a night piece hence usually of lyrical character

Nonet Composition for nine instruments

Notation Act of writing down music

Note Single sound of specified pitch and duration symbol to represent this

Obligato Instrumental part having a special or essential rôle in a piece

Oboe Woodwind instrument with double reed descended from hautboy as such in use since 16th cent in modern form since 18th cent

Octave Interval taking eight steps of scale with top and bottom notes having same name C to C is an octave

Octet Composition for eight instruments or voices

Ondes Martenot Belongs to a class of melodic instruments in which the tone is produced by electrical vibrations controlled by the movement of the hands not touching the instrument

Opera Musical work for the stage with singing characters originated in early years of 17th cent

Opera seria Chief operatic form of 17th and 18th cent usually set to very formal librettos concerning gods or heroes of ancient history

Operetta Lighter type of opera

Opus (abbr *Op*) With number following *opus* indicates order of a composer's composition

Oratorio Vocal work usually for soloists and choir with instrumental accompaniment generally with setting of a religious text

Orchestra Term to designate large or largish body of instrumentalists originated in 17th cent

Orchestration Art of setting out work for instruments of an orchestra. To be distinguished from *Instrumentation* (q.v.)

Organ Flabourate keyboard instrument in which air is blown through pipes by bellows to sound notes. Tone is altered by selection of various stops and since the 16th cent a pedal keyboard has also been incorporated

Organum In mediæval music a part sung as an accompaniment below or above the melody or plainsong usually at the interval of a fourth or fifth also loosely this method of singing in parts

Ornament Notes that are added to a given melody by composer or performer as an embellishment

Overture Instrumental introduction or prelude to larger work usually opera. Concert overtures are simply that i.e. work to be played at start of a concert

Part Music of one performer in an ensemble single strand in a composition.

Part song Vocal composition in several parts

Pastacaglia Composition in which a tune is constantly repeated, usually in the bass

Passage Section of a composition

Passion Musical setting of the New Testament story of Christ's trial and crucifixion

Pastiche Piece deliberately written in another composer's style

Pavan(e) Moderately paced dance dating from 16th cent or earlier

Pedal Held note in bass of composition.

Pentatonic Scale Scale of five notes—usually piano a five black keys or other notes in the same relation to each other

Percussion Collective title for instruments of the orchestra that are sounded by being struck by hand or stick

Phrygian Mode One of the scales of mediæval music represented by the white keys on piano from E to E

Piano Soft abbr *p* *pp* = *pianissimo* very soft instrument invented in 18th cent having strings struck by hammer as opposed to the earlier harpsichord where they are plucked. The modern piano has 88 keys and can be either upright (vertical) or grand (horizontal)

Pianoforte Almost obsolete full Italian name for the piano

Pitch Exact height or depth of a particular musical sound or note

Pizzicato Direction for stringed instruments that the strings should be plucked instead of bowed

Plainchant Plainsong Mediæval church music consisting of single line of melody without harmony or definite rhythm

Poll a Dance in 2/4 time originating in 19th cent Bohemia

Polonaise Polish dance generally in 3/4 time

Polyphony Combination of two or more musical lines as in *counterpoint*

Polytonality Simultaneous use of several keys

Postlude Closing piece opposite of Prelude

Prelude Introductory piece

Presto Very fast *Prestissimo* Still faster

Progression Movement from one chord to next to make musical sense

Quartet Work written for four instruments or voices group to play or sing such a work

Quaver Note that equals two semiquavers or half a crotchet

Quintet Work written for five instruments or voices group to play or sing such a work

Rallentando Slowing down

Recapitulation Section of composition that repeats original material in something like its original form

Recitative Term used for declamation in singing written in ordinary notation but allowing rhythmical licence

Recorder Woodwind instrument forerunner of flute

Reed Vibrating tongue of woodwind instruments

Register Set of organ pipes controlled by a particular stop used in reference to different ranges of instrument or voice (e.g. chest register)

Relative Term used to indicate common key signature of a major and minor key

Répétiteur Member of opera house's musical staff who coaches singers in their parts

Rest Notation of pauses for instrument in composition having a definite length like a note

Retrograde Term used to describe a melody played backwards

Rhapsody Work of no definite kind with a degree of romantic content

Rhythm Everything concerned with the time of music (i.e. beats accent metre etc) as opposed to the pitch side

Ritornello Passage usually instrumental that recurs in a piece

Pemance Romanza Title for piece of vague song like character

Romantic Term used vaguely to describe music of 19th cent that has other than purely musical source of inspiration

Rondo Form in which one section keeps on recurring

Rubato Manner of performing a piece without keeping strictly to time

Sacbut Early English name for trombone

Saxophone Classified as wind instrument although made of brass because it uses a reed

Scale Progression of adjoining notes upwards or downwards

Scherzo One of two middle movements usually third in four movement sonata form. Displaced minuet in this form at beginning of 19th cent

Score Copy of any music written in several parts

Second Interval taking two steps in scale e.g. C to D flat or to D

Semibreve Note that equals two minims or half a breve

Semiquaver Note that equals half a quaver

Semitone Smallest interval commonly used in Western music

Septet Composition for seven instruments or voices

Sequence Repetition of phrase at a higher or lower pitch

Serenade Usually an evening song or instrumental work

Seventh Interval taking seven steps in the scale

Sestet Composition for six instruments or voices

Sharp Term indicating a raising of pitch by a semitone

Saxum Primitive woodwind instrument fore-runner of oboe

Simple time Division of music into two or four beats

Sinfonietta Small symphony

Sixth Interval taking six steps in the scale

Solo Piece or part of a piece for one performer playing or singing alone

Sonata Term to denote a musical form and a type of composition. In *sonata form* a composition is divided into exposition development and recapitulation. A *sonata* is a piece, usually for one or more players following that form

Song Any short vocal composition

Soprano Highest female voice

Sostenuto Sustained broadly

Sotto voce Whispered scarcely audible applied to vocal as well as instrumental music

Sprechgesang (Ger. Speech song) Vocal utterance somewhere between speech and song

Staccato Perform music in short detached manner

Staff Horizontal lines on which music is usually written

Stop Lever by which organ registration can be altered

String(s) Strands of gut or metal set in vibration to produce musical sounds on string or keyboard instruments. Plural refers to violins violas cellos and basses of orchestra

Study Instrumental piece usually one used for technical exercise or to display technical skill but often having artistic merits as well (e.g. Chopin's)

Subject(s) Theme or group of notes that forms principal idea or ideas in composition

Suite Common name for piece in several movements

Symphony Orchestral work of serious purpose usually in four movements occasionally given name (e.g. Beethoven's Choral symphony)

Syncope Displacement of musical accent

Tempo Pace speed of music

Tenor Highest normal male voice

Ternary A piece in three sections is said to be in ternary form. The balance is obtained by repeating the first phrase or section (though it need not be exact or complete) after a second of equal importance

Tessitura Compass into which voice or instrument comfortably falls

Theme Same as *subject* but can also be used for a whole musical statement as in theme and variations

Third Interval taking three steps in scale

Time Rhythmical division of music

Tympani See Kettledrum

Toccata Instrumental piece usually needing rapid brilliant execution

Tonality Key or feeling for a definite key

Tone Quality of musical sound interval of two semitones

Tonic Sol fa System of musical notation to simplify sight reading

Transcribe Arrange piece for different medium instrument or voice than that originally intended

Transition Passage that joins two themes of sections of a composition

Transpose Perform a piece at different pitch from that originally intended

Treble Highest part in vocal composition high boy's voice

Triad A chord consisting of 3 note with the third and fifth above it e.g. C-E-G. A common chord is a triad of which the 5th is perfect e.g. C-E-G or C-E flat-G. Thus major and minor triads are common chords

Trio Work written for three instruments or voices group to play or sing such a work

Trombone Brass instrument with slide adjusting length of tube

Trumpet Metal instrument of considerable antiquity modern version has three valves to make it into a chromatic instrument

Tuba Deepest toned brass instrument with three or four valves

Twelve note Technique of composition using full chromatic scale with each note having equal importance. Notes are placed in particular order as the thematic basis of works.

Unison Two notes sung or played together at same pitch

Valve Mechanism invented in early 19th cent to add to brass instruments allowing them to play full chromatic scale

Variation Varied passage of original theme. Such variations may be closely allied to or depart widely from the theme

Verismo Term to describe Italian operas written in realist style at the turn of this century

Vibrato Rapid fluctuation in pitch of voice or instrument. Exaggerated it is referred to as a wobble (of singers) or tremolo

Viol String instrument of various sizes in vogue until end of 17th cent

Viola Tenor instrument of violin family

Violin Musical four string instrument played with bow of violin family which superseded viol at beginning of 18th cent.

Virginals English keyboard instrument similar to harpsichord of 17th and 18th cent

Vivace Lively

Voluntary Organ piece for church use but not during service

Waltz Dance in triple time fashionable in 19th cent

Whole tone scale Scale progressing by whole tones Only two are possible one beginning on C the other on C sharp

Xylophone Percussion instrument with series of wood bars tuned in a chromatic scale and played with sticks

Zither String instrument laid on knees and plucked Common in Central European folk music

III INDEX TO COMPOSERS

Adam de la Halle (d 1287)	3(2)	Donizetti Gaetano (1797-1848)	10(1)
Albéniz Isaac (1860-1909)	15(1)	Dufay (c 1400-74)	4(1)
Albinoni Tommaso (1671-1750)	6(1)	Dulac Paul (1865-1935)	14(1)
Arcadelt (c 1514-c 1570)	4(2)	Dunstable John (c 1380-1453)	4(1)
		Duparc Henri (1844-1933)	14(1)
Bach Carl Philipp Emanuel (1714-88)	7(1)	Dussek Jan Ladislav (1760-1814)	8(2)
Bach Johann Sebastian (1685-1750)	6	Dvořák Antonín (1841-1904)	12(1)
Balakireff Mily (1837-1910)	11(2)		
Barber Samuel (b 1910)	18(2)	Elgar Sir Edward (1857-1934)	13(2)
Bartók Bela (1881-1945)	12(2)		
Bax, Sir Arnold (1883-1953)	18(2)	Falla Manuel (1876-1946)	14(2)
Beethoven Ludwig van (1770-1827)	8	Farnaby Giles (latter half 16th cent)	4(2)
Bellini Vincenzo (1801-35)	10(1)	Fauré Gabriel (1845-1924)	14(1)
Bennett Richard Rodney	19(2)	Frankel César (1822-90)	13(2)
Berg Alban (1885-1935)	16(2)	Frankel Benjamin (b 1906)	19(2)
Berkeley Lennox (b 1903)	19(2)	Frescobaldi Girolamo (1583-1643)	4(2) 6(1)
Berlioz Hector (1803-69)	9(1)		
Binchois Gilles (c 1400-60)	4(1)	Gabriel Andrea (c 1510-86)	5(1)
Bliss Sir Arthur (b 1891)	19(2)	Gabriel Giovanni (1557-1612)	5(1)
Blow John (1649-1708)	5(2)	Geminiani, Francesco (1687-1762)	6(1)
Boccherini Luigi (1743-1805)	8(2)	Cesualdo Carlo (1560-1614)	5(1)
Boito Arrigo (1842-1918)	10(2)	Cibbons Orlando (1588-1625)	4(2)
Borodin Alexander (1833-87)	11(2)	Giordano Umberto (1867-1948)	17(2)
Boulez Pierre (b 1925)	18(1)	Glinka Mikhail (1804-57)	11(2)
Brahms Johannes (1833-97)	10(2)	Gluck, Christoph Willibald (1714-87)	7(2)
Britten Benjamin (b 1913)	18(2)	Goehr Alexander	19(2)
Bruckner Anton (1824-96)	10(2)	Gounod Charles (1818-93)	13(2)
Busoni Ferruccio (1866-1924)	17(1)	Granados Enrique (1867-1916)	14(2) 15(1)
Byrd William (c 1542-1623)	4(2)	Grieg Edvard (1843-1907)	18(2)
		Guido d'Arezzo (c 990-1050)	3(2)
Cabezón Antonio de (1510-66)	4(2)	Guillaume de Machant (1300-77)	4(1)
Caccini, Giulio (c 1558-1615)	5(1)		
Carissimi Giacomo (c 1604-74)	5(1)	Halévy Jacques François (1799-1862)	10(1)
Cavalleri, Emilio di (c 1550-1600)	5(2)	Handel, George Frederic (1685-1759)	6(2)
Cavalli Pietro Francesco (1602-76)	5(1)	Hauer Josef (1888-1959)	16(1)
Cesti Marc'Antonio (1623-69)	5(1)	Haydn, Franz Joseph (1732-1809)	7
Chopin Frédéric François (1810-49)	9(2)	Henze Hans Werner (b 1926)	18(1)
Cimarosa Domenico (1749-1801)	8(2)	Hindemith, Paul (1895-1963)	18(1)
Copland, Aaron (b 1900)	18(1)	Holst, Gustav (1874-1934)	18(2)
Corelli Arcangelo (1653-1713)	6(1)	Honegger Arthur (1892-1955)	18(1)
Couperin, François (1668-1733)	6(1)	Hummel, Johann Nepomuk (1778-1837)	8(2)
Cui César (1835-1918)	11(2)		
Debussy Claude (1862-1918)	13(2)		
Delius Frederick (1862-1934)	18(2)	Ireland, John (1879-1962)	18(2)
d'Indy Vincent (1851-1931)	14(2)	Ives Charles (1874-1954)	18(2)

INDEX TO COMPOSERS

Janacek Leos (1858-1928)
 Josquin des Frés (c 1450-1521)

Kodály Zoltán (1882-1967)

Landini Francesco di (c 1325-97)
 Lassus Orlandus (c 1532-94)
 Lawes Henry (1596-1662)
 Leoncavallo Ruggiero (1858-1919)
 Léonin (12th cent)
 Liszt Franz (1811-86)
 Lully Jean Baptiste (c 1632-87)
 Lutyens Elisabeth (b 1906)

MacDowell Edward Alexander (1861-1908)
 Mahler Gustav (1860-1911)
 Mascagni Pietro (1863-1945)
 Massenet, Jules Emile Frédéric (1842-1912)
 Maw Nicholas
 Méhul Etienne Nicolas (1763-1817)
 Mendelssohn Felix (1809-47)
 Messiaen Olivier (b 1908)
 Meyerbeer Giacomo (1791-1864)
 Milhaud Darius (b 1892)
 Monte Philippe de (c 1521-1603)
 Monteverdi Claudio (1567-1643)
 Mozart Wolfgang Amadeus (1756-91)
 Mussorgsky Modest (1839-81)

Nielsen Carl (1865-1931)
 Neri Saint Philip (1515-95)

Ockeghem (c 1420-95)
 Orff Carl (b 1895)

Pachelbel, Johann (1653-1706)
 Paisiello Giovanni (1740-1816)
 Palestrina (c 1525-94)
 Parry Sir Hubert (1848-1918)
 Pedrell, Felipe (1841-1922)
 Pérr Jacopo (1561-1633)
 Pérotin (early 12th cent)
 Pfitzner Hans (1869-1949)
 Philippe de Vitry (1291-1361)
 Poulenc, Francis (1899-1968)
 Power Lionel (15th cent)
 Prokofiev Sergey (1891-1953)
 Puccini, Giacomo (1858-1924)
 Purcell, Henry (1658-95)

Rachmaninov Sergey (1873-1943)
 Rameau, Jean-Philippe (1683-1764)

E26

THE WORLD OF MUSIC

Ravel Maurice (1875-1937)
 Rawsthorne Alan (b 1905)
 Reger Max (1873-1916)
 Rimsky-Korsakov Nikolai (1844-1908)
 Rossini Gioacchino Antonio (1792-1868)
 Rubbra Edmund (b 1901)

Saint Saens Camille (1835-1921)
 Satie Eric (1866-1925)
 Scarlatti Alessandro (1660-1725)
 Scarlatti Domenico (1685-1737)
 Scheidt Samuel (1587-1654)
 Schoen Johann Hermann (1586-1630)
 Schoenberg Arnold (1874-1951)
 Schubert Franz Peter (1797-1828)
 Schumann Robert Alexander (1810-56)
 Schutz Heinrich (1585-1672)
 Scriabin Alexander (1872-1915)
 Shostakovich Dmitri (b 1906)
 Sibelius Jean (1865-1957)
 Smetana Bedrich (1824-84)
 Spontini Gasparo Luigi Pacifico (1774-1851)
 Stradella Alessandro (1642-82)
 Stanford Sir Charles Villiers (1852-1924)
 Stamitz Johann (1717-57)
 Stamitz Karl (1746-1801)

	Table of Elements	66

THE WORLD OF SCIENCE

In Parts I, II and III the miniature universe is described. This is the domain of cosmology, astronomy, geology, physics and chemistry. There are already many interesting links which join this realm to that of the living and make it difficult to say where the boundary lies. Nevertheless, it is still convenient to accord to the biological and social sciences two separate chapters, Parts IV and V. In Part VI our intention is to give some short accounts of recent developments in both science and technology. They are usually contributed by scientists actively engaged in these, their own special fields.

I ASTRONOMY AND COSMOLOGY—THE NATURE OF THE UNIVERSE

The universe includes everything from the smallest sub-atomic particle to the mightiest system of stars. The scientific view of the universe (not the only view but the one we are concerned with here) is a remarkable achievement of the human mind and it is worth considering at the outset what a scientific view is and what is remarkable about it.

A scientific view of something is always an intimate mixture of theories and observed facts and not an inert mixture but a seething and growing one. The theories are broad general ideas to gather with arguments based on them. The arguments are designed to show that if the general ideas are accepted then this, that or the other thing ought to be observed. If this that or the other actually are observed then the theory is a good one. If not then the theoreticians have to think again. Thus theoretical ideas and arguments are continually subjected to the severe test of comparison with the facts and scientists are proud of the rigour with which this is done. On the other hand theories often suggest new things to look for and theories lead to predictions. These predictions are frequently successful and scientists are entitled to be proud of that too. But it follows that no theory is immutable, any scientific view of any subject may in principle be invalidated at any time by the discovery of new facts though some theories are so soundly based that overthrow does not seem imminent.

A remarkable aspect of the scientific view of the universe is that same principles are supposed to operate throughout the whole vastness of space. Thus the matter and radiation in stars are not different from the matter and radiation on earth and their laws of behaviour are the same. Therefore theories hard won by studies in terrestrial physics and chemistry laboratories are applied at once to the whole cosmos. Astronomy and cosmology are spectacular extensions of ordinary mechanics and physics.

LOOKING AT THE UNIVERSE

The universe is observable because signals from it reach us and some manage to penetrate our atmosphere.

First there are waves of visible light together with invisible rays of somewhat longer (infra red) and somewhat shorter (ultra violet) wavelengths. These waves show us the bright astronomical objects and to make use of them astronomers have constructed telescopes of great power and precision backed up with cameras, spectroscopes and numerous auxiliaries. The most powerful telescope at Mt Palomar, California has a 200 inch diameter mirror. The next major advance in optical telescope performance probably awaits the erection of telescopes on satellites outside the earth's atmosphere which at present acts as a distorting and only partially transparent curtain.

Secondly there are radio waves of much longer wavelength than light. These can be detected by sensitive radio receivers with special aerial systems. These are the radio telescopes. The most

well known British one is at Jodrell Bank and it started working in 1957.

Other types of radiation from outer space impinge on the atmosphere. Cosmic radiation consists of very fast moving fundamental particles including protons (F14). Cosmic rays are detected by Geiger counters, by the minute tracks they leave on photographic plates and by other means. The origin of cosmic rays is still uncertain but many people think they must have an intimate connection with the nature and evolution of the universe itself.

X rays and neutrinos (F14) from outer space can also be detected the former especially by satellite borne detectors and the latter by apparatus buried in deep mines. X ray astronomy and neutrino astronomy are being born.

By interpreting the signals that reach us by these various routes astronomers have formed a remarkably detailed picture of its structure. The merest outline of this will now be given.

Great Distances and Large Numbers

Let us start with nearby objects. This raises at once the question of what nearness and distance are in astronomy and how they are to be expressed. A convenient unit of distance is the *light year* i.e. the distance that light travels in 186 000 miles per second traverses in one year. Since vast numbers as well as vast distances will enter the question we need a shorthand for large numbers. Ten times ten times ten will be represented by 10^3 , six tens multiplied together (i.e., one million) will be written 10^6 and so on. 10^{14} would mean a hundred million million. One divided by a million (i.e. one millionth) will be written 10^{-6} , the very small number obtained by dividing one by the product of fourteen tens will be written 10^{-14} . A light year is 5.88×10^{12} miles, the radius of an atom is about 10^{-8} cm.

PLANETS, STARS AND GALAXIES

The Solar System.

The earth is the third counting outwards of nine planets revolving in nearly circular orbits round the sun. Their names and some other particulars are given in the table (F7). The sun and its planets are the main bodies of the solar system. Between Mars and Jupiter revolve numerous chunks of rock called the asteroids, the largest of these Ceres is 480 miles across. Apart from these the solar system is tenuously populated with gas dust and small particles of stone and iron. Dust continuously settles on the earth and frequently small fragments enter the atmosphere, glow and evaporate, these are meteors or shooting stars. Sometimes larger rocks called meteorites hit the earth. Comets are relatively compact swarms of particles—containing ice according to one theory—which travel in elongated orbits round the sun. Their spectacular tails form under the sun's influence when they approach it. Not all comets stay indefinitely in the solar system, some visit us and go off into space for ever.

The sun itself is a dense roughly spherical mass of glowing matter 865 000 miles across. Its heat is so intense that the atoms are split into separated electrons and nuclei (see F10) and matter in such a state is called plasma. At the sun's centre the temperature has the unimaginable value of about 13 million degrees Centigrade (a coal fire is about 800 C). Under such conditions the atomic nuclei frequently collide with one another at great speeds and reactions occur between them. The sun consists largely of hydrogen and in the very hot plasma the nuclei of hydrogen atoms interact by a series of reactions whose net result is to turn hydrogen into helium. This is a process which releases energy just as burning does only these nuclear processes are incomparably more energetic than ordinary burning. In fact the energy released is great enough to be the source of all the light and heat which the sun has been pouring into space for thousands of millions of years.

Emerging from the sun and streaming past the earth is a solar wind of fast-moving electrons and protons (see F10) whose motion is closely linked with the behaviour of an extensive magnetic field based on the sun. In fact the region round the sun and extending far into space past the earth is full of complex fluctuating particle streams and magnetic fields which interact with planetary atmospheres causing among other things auroras and magnetic storms.

Stars

In colour brightness age and size the sun is typical of vast numbers of other stars. Only from the human point of view is there anything special about the sun—it is near enough to give us life. Even the possession of a system of revolving planets is not according to some modern views very unusual.

No star can radiate energy at the rate the sun does without undergoing internal changes in the course of time. Consequently stars evolve and old processes in them give rise to new. The exact nature of stellar evolution—so far as it is at present understood—would be too complex to describe here in any detail. It involves expansion and contraction changes of temperature changes of colour and changes in chemical composition as the nuclear processes gradually regenerate new chemical elements by reactions such as the conversion of hydrogen to helium helium to neon neon to magnesium and so on. The speed of evolution changes from time to time but is in any case very slow compared with the pace of terrestrial life nothing very dramatic may occur for hundreds of millions of years. Evidence for the various phases of evolution is therefore obtained by studying many stars each at a different stage of its life. Thus astronomers recognise many types with charmingly descriptive names such as blue giants sub giants red and white dwarfs supergiants.

The path of stellar evolution may be marked by various explosive events. One of these which occurs in sufficiently large stars is an enormous explosion in which a substantial amount of the star is blown away into space in the form of high speed streams of gas. For about a fortnight such an exploding star will radiate energy 200 million times as fast as the sun. Japanese and Chinese (but not Western) astronomers recorded such an occurrence in A.D. 1054 and the exploding gases now called the Crab nebula can still be seen in powerful telescopes and form a cloud six or seven light years across. While it lasts the explosion shows up as an abnormally bright star and is called a *supernova*.

Groups of Stars

It is not surprising that ancient peoples saw pictures in the sky. The constellations however are not physically connected groups of stars but just happen to be patterns visible from earth. A conspicuous exception to this is the Milky Way which a telescope resolves into many millions of separate stars. If we could view the Milky Way from a vast distance and see it as a whole we should observe a rather flat wheel of stars with spiral arms something like the sparks of a rotating

Catherine wheel. This system of stars is physically connected by gravitational forces and moves through space as a whole. It is called a *galaxy*.

The galaxy is about 10^5 light years across and contains roughly 10^{11} stars. An inconspicuous one of these stars near the edge of the wheel is our sun. The prominent stars in our night sky are members of the galaxy that happen to be rather near us. Sirius the brightest is only 8.6 light years away a trivial distance astronomically speaking.

The galaxy does not contain stars only there are also clouds of gas and dust particularly in the plane of the galaxy. Much of the gas is hydrogen and its detection is difficult. However gaseous hydrogen gives out radio waves with a wavelength of 21 cm. Radio telescopes are just the instruments to receive these and workers in Holland America and Australia detected the gas clouds by this means. In 1952 they found that the hydrogen clouds lie in the spiral arms of the galaxy and thus is some of the strongest evidence for the spiral form.

Another important feature of the galactic scene is the weak but enormously extensive magnetic field. This is believed to have an intimate connection with the spiral structure.

Around the spiral arms and forming part of the galaxy are numerous globular clusters of stars. These are roughly spherical abnormally densely packed collections of stars with many thousands of members. Because of its form and density a globular cluster may be assumed to have been formed in one process not star by star. Thus all its stars are the same age. This is of great interest to astronomers because they can study differences between stars of similar age but different sizes.

Galaxies

One might be forgiven for assuming that such a vast system as the galaxy is in fact the universe but this is not so. In the constellation of Andromeda is a famous object which on close examination turns out to be another galaxy of size and structure similar to our own. Its distance is given in the table (F7). The Milky Way the Andromeda Nebula and a few other smaller galaxies form a cluster of galaxies called the Local Group. Obviously it would not be so named except to distinguish it from other distinct groups and it is indeed a fact that the universe is populated with groups or clusters of galaxies. A cluster may contain two or three galaxies but some contain thousands. So far as the eye of the telescope and camera can see there are clusters of galaxies.

On a photograph a galaxy is a nebulous blob without the hard outline that a single star produces. Such nebulae were formerly thought to be inside the Milky Way but after controversy it was established that many of them were separate distant galaxies. By about 1920 it was known that there were at least half a million galaxies and with the advent of the 100 in. Mt. Wilson telescope this number rose to 10^9 and is being increased further by the 200 in telescope which can see out to a distance of 7×10^9 light years. Through the powerful telescopes the nearer galaxies reveal their inner structures. Photographs of galaxies are among the most beautiful and fascinating photographs ever taken and readers who have never seen one should hasten to the nearest illustrated astronomy book. Recent careful co-operation between optical and radio astronomers has revealed that some very remote galaxies are strong sources of radio waves. Sometimes these radio galaxies have unusual structures suggestive of violent disturbance.

The Expanding Universe

Two discoveries about galaxies are of the utmost importance. One is that by and large clusters of galaxies are uniformly distributed through the universe. The other is that the distant galaxies are receding from us.

How is this known? Many readers may be familiar with the Doppler effect first discovered in 1842. Suppose a stationary body emits waves of any kind and we measure their wavelength finding it to be L ms. Now suppose the body

THE ORIGIN AND DEVELOPMENT OF THE UNIVERSE

approaches us the waves are thereby crowded together in the intervening space and the wave length appears less than λ . If the body recedes the wavelength appears greater than λ . The Austrian physicist J. Doppler (1803-58) discovered this behaviour in sound waves and it explains the well known change of pitch of a train whistle as it approaches and passes us. The same principle applies to the light. Every atom emits light of definite wavelengths which appear in a spectroscopic as a series of coloured lines—a different series for each atom. If the atom is in a receding body all the lines have slightly longer wavelengths than usual and the amount of the change depends uniquely on the speed. Longer wavelengths mean that the light is redder than usual so that a light from a receding body shows what is called a red shift. The speed of recession can be calculated from the amount of red shift.

It was the American astronomer V. M. Slipher who first showed (in 1914) that some galaxies emitted light with a red shift. In the 1920s and 1930s the famous astronomer E. Hubble (1889-1953) measured both the distances and red shift of many galaxies and proved what is now known as Hubble's Law. This states that the speed of recession of galaxies is proportional to their distance from us. This does not apply to our neighbours in the Local Group and they are keeping together. Hubble's Law has been tested and found to hold for the farthest detectable galaxies: they are about 7×10^9 light years away and are receding with a speed of that of light.

Does this mean that the Local Group is the centre of the universe and that everything else is rushing away from us? No. Hubble's Law would appear just the same from any other cluster of galaxies. Imagine you are in a square on some fabulous chess board which is steadily doubling its size every hour: all other squares double their distances from you in an hour. Therefore the farther squares from you must travel faster than the nearer ones: in fact Hubble's Law must be obeyed. But anyone standing in any other square would get the same impression.

This extraordinary behaviour of the universe is one of the most exciting discoveries of science. Let us envisage its possible implication: if the galaxies have always been receding then in the past they must have been closer together. Following this to its conclusion it seems that all the matter in the universe must have been packed densely together about 10^{10} years ago. Was this really so? The lack of any definite answer to this question is one of the things that makes cosmology so interesting.

Quasars and Pulsars

In November 1962 Australian radio astronomers located a strong radio emitter with sufficient precision for the Mt. Palomar optical astronomers to identify it on photographs and examine the nature of its light. The red shift was so great that the object must be exceedingly distant: on the other hand it looked star like much smaller than a galaxy. By the beginning of 1967 over a hundred of these objects had been discovered and other characteristics established such as strong ultra-violet radiation and inconstancy in some cases of the rate at which radiation is emitted. Not all of these so-called quasars are strong radio emitters: some show all the other characteristics except radio emission. It has been estimated that the quiet kind are about a hundred times more numerous than the radio kind. One great problem here is how can such relatively small objects generate such inconceivably great amounts of energy that they appear bright at such huge distances? So far this is unanswered: these quasi-stellar objects are a great mystery though they are generally held to be an important pointer towards a deeper understanding of cosmology.

Late in 1967 while investigating quasars Cambridge radio astronomers discovered pulsars: a new type of heavenly body. Their characteristic is the emission of pulses of radio waves every second or so with a repetition rate that is regular to at least a part in 10^8 . At present they are believed to be peculiar stars hardly bigger than the Earth and situated inside our galaxy.

Errors of observation and interpretation occur of course. But there are many checks and repetitions made so that on the whole the descriptive account of the universe would be generally agreed among astronomers. When it comes to inventing theoretical explanations however science is on less sure ground and indeed the theory of the universe is an arena of controversy at present. In most other sciences experiments can be repeated and the same phenomena observed under differing but controlled conditions. This is very helpful. But by definition there is only one universe: one cannot repeat it or do experiments with it. On the other hand it must be remembered that the light from distant galaxies has taken perhaps 10^9 years to reach us so it tells us what the galaxies were like that number of years ago. Therefore we are not confined simply to describing the present state of the universe: by looking further into space we are looking further into the past as well. How then does the state of the universe vary with time?

Evolutionary Theories

One answer to this can be obtained from Einstein's general theory of relativity. Some slight indication of what this theory is about is given on page F15 and its logical development is of course a matter for mathematical specialists. It turns out that if we assume that matter is distributed uniformly throughout space (as observation strongly suggests), then the solutions of Einstein's equations show how the state of the universe may vary with time. Unfortunately there are many possible solutions corresponding to expanding static or contracting universes. As we have already seen the actual universe is expanding: therefore the static and contracting solutions can be ruled out. There is still a multiplicity of expanding possibilities: some correspond to indefinite expansion from an initially very dense state; others to expansion followed by contraction to a dense state followed by expansion and so on repeatedly: i.e. a pulsating universe. The dense state is presumably to be identified with the time when the receding galaxies were all concentrated near one another possibly in some dense conglomeration of atoms. This initial state is thought by some to be the origin of the universe: they would say it has been expanding and evolving ever since. If the universe is pulsating then sooner or later gravitational attractions between galaxies will slow the observed recession down and turn it into a mutual approach and so back to the dense state. A straightforward application of the mathematics makes this dense state *infinitely* dense and presumably something must happen before this inconceivable situation arises. For example forces between atomic nuclei may play an important part and determine what the dense state (if any) is actually like.

The Steady-State Theory

A rival theory was proposed in 1948 by Bondi, Gold and Hoyle. They suggested that the universe is not changing with time: there was no initial dense state and no pulsations: the universe always has been and always will be like it is now. This does not mean that no local changes can be observed—this would clearly be contrary to the facts. But it does mean that on the large scale the clusters of galaxies have a distribution which is uniform in space and unchanging in time. If the numbers of clusters of galaxies in a large volume of space were counted every few thousand million years the answer would always be the same.

At first sight this appears to contradict outright the observed expansion of the universe. For if the galaxies are receding from one another how can the number in a given volume remain constant? The situation is saved by a bold proposal: it is that matter in the form of hydrogen atoms is being *continuously created* throughout space. This gas accumulates in due course into new galaxies so that as the old ones move apart the young ones appear to keep the numbers up. The

necessary amount of continuous creation can be calculated and is equivalent to the appearance of one atom in an average sized room every 20 million years. If this seems absurdly small try calculating the rate of creation in tons per second in a sphere of radius 10^9 light years.

The rate of creation is however much too small to have affected any of the laws of ordinary physics. The famous law of the conservation of matter (matter can neither be created nor destroyed) is violated but on such a small scale that physicists it is said, should not complain. Nevertheless some do complain and see in this violation a strong point against this theory.

The Formation of Galaxies and Stars

On any theory of the universe some explanation has to be found for the existence of clusters of galaxies. In all theories galaxies condense out from dispersed masses of gas principally hydrogen.

Once a huge gas cloud becomes sufficiently condensed to be separately identifiable as a galaxy further condensation goes on inside it. It is believed on theoretical grounds that it could not condense into one enormous star but must form many fragments which shrink separately into clusters of stars. In these clusters many stars perhaps hundreds or thousands or even millions, are born at once. A small cluster visible to the naked eye is the Pleiades. The Orion nebula, visible as a hazy blob of glowing gas in the sword of Orion is the scene of much star forming activity at present.

According to the evolutionary theory the initial dense state consisted of very hot plasma in a state of overall expansion. The expanding plasma was both cooling and swirling about. The random swirling produces irregularities in the distribution of the hot gas—here it would be rather denser there rather less dense. If a sufficiently large mass of denser gas happened to occur then the gravitational attraction between its own particles would hold it together and maintain its permanent identity even though the rest of the gas continued to swirl and expand. Such a large mass would gradually condense into fragments to become galaxies, the whole mass turning into a cluster of galaxies.

The steady state view is interestingly and significantly different for on this theory galaxies have always been present and the problem is one of finding how existing galaxies can generate new ones out of the hydrogen gas which is supposed to be continuously created everywhere. More over this has to be done at just the right rate to maintain the galactic population density constant—otherwise it would not be a steady state theory.

A theoretical proposal allowing for galaxy creation was in fact provided by steady state cosmologists but will not be outlined here because it now seems that the steady state theory is losing ground.

The Changing Scene

The 1960s witnessed revolutionary developments in both observational and theoretical astronomy. By 1966 the attractive simplicity of the original steady state theory had been obscured by modifications forced upon its protagonists by new evidence or theoretical objections. It is an interesting and significant fact that the apparent demise of the steady state theory has resulted from a welcome injection into cosmology of the characteristic activity of the other sciences namely the comparison of theory with observation. For example it now seems agreed after some years of uncertainty that remote sources of radio waves are more abundant the weaker their intensity. This strongly suggests that they are more abundant at greater distances. Thus the universe is not uniform as the original steady-state theory prescribed. Since greater distances correspond to earlier times, any extra abundance of objects observed at the greater distance means that the universe was denser in its younger days than now. This favours an evolutionary theory of the universe.

The same theory requires that the initial dense state of the universe—applied christened the primeval fireball—should contain intense

electromagnetic radiation with a distribution of wavelengths characteristic of the high temperature. As the fireball *i.e.* the universe expanded over a period of about 10^{10} years it cooled and one feature of this process is that the wavelengths of the radiation increase and their distribution becomes characteristic of a much lower temperature. In fact the wavelengths should now be concentrated round about 1 mm to 1 cm (corresponding to about $2-270^\circ\text{C}$) and the radiation should approach the earth uniformly from all directions. Radiation just like this has recently been detected in several laboratories first by Penzias and Wilson in America during 1965. They used very sensitive radio receivers originally designed to detect signals from artificial satellites. No plausible terrestrial or galactic origin for the radiation has yet been conceived, the waves appear to have something to do with the universe itself. Neither is there a rational basis for the radiation within the steady state theory which probably receives here its *coup de grâce*. The evolutionary theory survives so far.

The Formation of the Chemical Elements

A stable nucleus is one that lasts indefinitely because it is not radioactive. There are 274 known kinds of stable atomic nuclei and little likelihood of any more being found. These nuclei are the isotopes (see F10) of 81 different chemical elements. The other elements including for example uranium and radium are always radioactive. Some elements are rare others abundant. The most common ones on earth are oxygen silicon aluminium and iron. However the earth is rather atypical. It is especially deficient in hydrogen because the gravitational attraction of our small planet was not strong enough to prevent this very light gas from escaping into space.

It is possible to examine the chemical constituents of meteorites and to infer the composition of the sun and other stars from the spectrum of the light they emit. By such means the conclusion has been reached that 99% of the atoms in our galaxy are hydrogen 7% are helium all the other elements together account for about one in a thousand atoms. A glance at the Table of Elements (F 66) will show that hydrogen and helium are two of the lightest elements they are in fact the two simplest.

According to the steady state theory hydrogen atoms are constantly being created. The evolutionary theory supposes that the dense initial state was a system of very hot protons and electrons *i.e.* split up hydrogen atoms. In either case therefore the problem is to explain how the heavier chemical elements appear in the universe at all. It is here that a fascinating combination of astronomy and nuclear physics is required.

We have already referred to the fact that the energy radiated from the sun originates in nuclear reactions which turn hydrogen into helium. Why is energy given out? To answer this question we note that nuclei are made up of protons and neutrons (see F10). These particles attract one another strongly—that is why a nucleus holds together. To separate the particles energy would have to be supplied to overcome the attractive forces. This amount of energy is called *binding energy* and is a definite quantity for every kind of nucleus. Conversely when the particles are brought together to form a nucleus the binding energy is released in the form of radiations and heat. Different nuclei consist of different numbers of particles therefore the relevant quantity to consider is the *binding energy per particle*. Let us call this *B*. Then if elements of high *B* are formed out of those of low *B* there is a release of energy.

Now *B* is small (relatively) for light elements like lithium, helium and carbon. It rises to a maximum for elements of middling atomic weight like iron. It falls again for really heavy elements like lead bismuth and uranium. Consequently energy is released by forming middleweight elements either by splitting up heavy nuclei (nuclear fission) or by joining up light ones (nuclear fusion).

It is the latter process fusion that is going on in stars. The fusion processes can be studied in physics laboratories by using large accelerating

machines to hurl nuclei at one another to make them coalesce. In stars the necessary high velocity of impact occurs because the plasma is so hot. Gradually the hydrogen is turned into helium and helium into heavier and heavier elements. This supplies the energy that the stars radiate and simultaneously generates the chemical elements.

The very heavy elements present a problem. To form them from middleweight elements energy has to be supplied. Since there is plenty of energy made a star a certain small number of heavy nuclei will indeed form but they will continually undergo fission again under the prevailing intense conditions. How do they ever get away to form cool ordinary elements like lead and bismuth in the earth? One view links them with the highly explosive supernovæ to which we have already referred (F4 (1)). If the heavy elements occur in these stars the force of the explosion disperses them into cool outer space before they have time to undergo the fission that would otherwise have been their fate. The heavy elements are thus seen as the dust and debris of stellar catastrophes. This view is in line with the steady state theory because supernovæ are always occurring and keeping up the supply of heavy elements. In the evolutionary theory some of the generation of elements is supposed to go on in the very early stages of the initial dense state and to continue in the stars that evolve in the fullness of time. It cannot be claimed that the origin of the chemical elements is completely known but we have said enough to show that there are plausible theories. Time and more facts will choose between them.

The Formation of the Planets

Did the sun collect its family of planets one by one as a result of chance encounters in the depths of space? Or was the solar system formed all at once in some generative process? To this fundamental question at least there is a fairly definite answer. The planetary orbits all lie in about the same plane and the planets all revolve the same way round the sun. This could hardly have happened by chance indeed it provides almost conclusive evidence for the alternative view. But what was the generative process?

Many ideas have been proposed and the problem is very intricate. One view is that the sun and its planets formed in a stellar condensation a feature of which was the pushing outwards from the central sun of a disc of matter which subsequently became the planets. Such a process would be regarded as normal in stars and not exceptional.

On the other hand the planets have been attributed to the effect of a passing star whose gravitational attraction drew out from the sun a jet of gaseous matter which condensed into the planets. Such an encounter between stars is very rare and on this theory the formation of planets must be an outside chance. This theory is not widely held now.

The connection between stellar and planetary theory is brought out again by the existence on the planets of the heavier chemical elements. How did they get there? If it be true that heavy elements are hurled into space by exploding supernovæ (see above) then at least one such explosion must have mingled its products with the wide spread interstellar hydrogen before the planets condensed. At one time Hoyle put forward the view that the sun was once accompanied by another star (there are many such binary systems known to astronomers) and that the sun's partner exploded. Some of the ejected gases captured by the sun's gravitational attraction later condensed into planets while the remnant of the star recoiled from the explosion and got away into space. This explanation was later modified in that the exploding star and the sun need not be a close pair but merely two of a cluster of stars formed at the same time.

Before leaving this subject where theories are more numerous than firm conclusions one more question may be raised: was the earth formed hot or cold? There are adherents to both opinions. One side would say that the planets condensed from hot gases became liquid and subsequently cooled and solidified at the surface if not through out. Others would say that dust and small particles formed in space first and subsequently accumulated into large bodies whose temperature rose somewhat later on. With space exploration beginning in earnest considerable future progress in understanding planetary formation can be anticipated. (See also Section L, Mars Venus Planets.)

THE SOLAR SYSTEM.

Name	Distance from Sun (millions of miles)	Diameter (thousands of miles)	Average density (water = 1)	Number of Satellites
Sun	—	865	1.41	—
Mercury	36	3.1	5.73	0
Venus	67	7.6	5.23	0
Earth	93	7.9	5.52	1
Mars	142	4.2	3.94	2
Jupiter	484	85.0	1.34	12
Saturn	887	70.0	0.69	9
Uranus	1785	30.9	1.36	5
Neptune	2797	33.0	1.32	2
Pluto	3670	?	?	0

SOME ASTRONOMICAL DISTANCES

(1 light year = 5.88×10^{12} miles)

Object	Distance from Earth (light-years)	Velocity of recession (miles per second)	Object	Distance from Earth (light-years)	Velocity of recession (miles per second)
Sun	1.6×10^{-5}	—	Andromeda Galaxy	1.5×10^6	—
Nearest star (Proxima Centauri)	4.2	—	Galaxy in Virgo	7.5×10^7	750
Brightest star (Sirius)	8.6	—	Galaxy in Gt Bear	10^8	9,800
Pleiades	340	—	Galaxy in Corona	—	—
Centre of Milky Way	2.6×10^4	—	Borealis	1.3×10^8	13,400
Magellanic clouds (the nearest galaxies)	1.6×10^5	—	Galaxy in Bootes	4.5×10^8	24,400
			Very remote quasi stellar object	$\sim 1.5 \times 10^{10}$	$\sim 150,000$

THE EARTH

Structure

The earth has the shape of a slightly flattened sphere with an equatorial radius of 6378 km and a polar radius 21 km less. Its mass can be calculated from Newton's Law of Gravitation and from measurements of the acceleration due to gravity and is 5.97×10^{24} kg. The average density follows from these two figures and is about 5.5 grams per cubic centimetre. This is nearly twice the density of typical rocks at the surface so there must be very much denser material somewhere inside and the earth must have a definite internal structure.

This structure can be investigated using shock waves from earthquakes or large explosions. These are received at recording stations at different distances from their source having penetrated to varying depths within the earth and their relative times of arrival and characteristic forms enable the deep structure to be worked out. This consists of three main units: a core at the centre with a radius about half that of the earth, the mantle outside this and the thin crust about 35 km thick under the continents and 5 km thick under the oceans forming a skin surrounding the mantle.

The composition of these three units can be deduced by observation and inference. For example, meteorites which arrive at the earth's surface from other parts of the solar system consist of three main types composed of iron-nickel alloy, stony silicates and a mixture of iron and silicates. Could these have originated from the break up of some planet like the earth? If so, then perhaps the core of the earth is made up of iron-nickel alloy and the mantle of magnesium-rich silicates. Experiments on the physical properties of these materials at high pressures show strong similarities with the measured properties of the earth's interior. In addition, rocks composed of magnesium-rich silicates are found at the earth's surface in places where material seems to have come from great depth, such as in the debris from volcanic explosions. These may be direct samples of the earth's mantle.

Core, Mantle and Crust

By these arguments and by many others, a picture can be built up of the internal structure of the earth. The core is composed of iron-nickel alloy. It is liquid at the outside but contains a solid inner core of radius about one-fifth of that of the earth. Convection currents flowing in the liquid part give rise to the earth's magnetic field. Outside this the mantle is solid and is made up mainly of magnesium-iron silicates of various kinds. By studying its physical properties through earthquake wave observations, the mantle may be divided into several zones of which the most important is the asthenosphere. This is the part of the mantle between 70 and 300 km depth in which volcanic lavas are formed. In this region the mantle is everywhere quite near to the temperature at which it begins to melt and is thus rather soft compared with the rest of the mantle. The presence of a soft asthenosphere accounts for many of the surface features of the earth: mountain belts and ocean basins that make it so very different from cratered planets such as the Moon and Mars.

The sharp boundary between mantle and crust is called the Mohorovičić Discontinuity. Above it the crust is different under continents and oceans. The thick continental crust has a composition that can broadly be called granitic while the thin oceanic crust is poorer in silicon, sodium and potassium and richer in calcium, iron and magnesium. The continental crust has been built up over thousands of millions of years by welding together mountain belts of different ages while the oceanic crust is made up of basaltic lavas and is nowhere older than 250 million years.

Rocks

Rocks are naturally occurring pieces of the solid earth. If you take a rock and break it up into grains, then separate the grains into different heaps of like grains, each heap will consist of

grains of the same mineral. For example, the kind of rock called granite can be divided into glassy grains of the mineral quartz, milky white or pink grains of the mineral feldspar, shiny black flakes of the mineral biotite and shiny colourless flakes of the mineral muscovite. Both biotite and muscovite belong to the mica group of minerals. Each different mineral has a well-defined composition or range of composition and a definite and characteristic arrangement of the atoms that compose it. There are several thousand known kinds of minerals but only fifty or so are at all common.

There are three main kinds of rock: igneous rocks formed by the solidification of molten lava; sedimentary rocks formed from material laid down under gravity on the earth's surface and metamorphic rocks formed by heating or reheating of either of the other kind of rock. Each of these broad groups may be further subdivided. When igneous rocks solidify deep inside the earth, they cool slowly and large crystals have time to form. Coarse-grained igneous rocks such as granites are known as plutonic igneous rocks. Conversely, the rapidly cooled fine-grained igneous rocks that form the volcanic lavas such as basalts and rhyolites are called volcanic igneous rocks. Sedimentary rocks can be divided into three kinds. Clastic sediments are those formed from mechanically abraded and transported fragments of pre-existing rocks and include sandstone, mudstone and clay. Organic sediments are those composed as are most limestones of fragments of organically produced material such as shells, wood and bone. Chemical sediments are formed by direct chemical action and include most typically salt deposits formed by evaporation of sea water. Metamorphic rocks are more difficult to subdivide. They are usually classified on the basis of their original composition and/or the maximum pressure and temperature to which they have been subjected. Chemical reactions in metamorphic rocks give rise to successions of minerals as the pressure and temperature change so that examination of a metamorphic rock will often allow one to say how deeply it was buried and how hot it was.

Age of Rocks

There are two distinct ways of estimating the age of rocks. The first gives the relative age. It is based on the principle that in a sequence of sediments, older rocks lie underneath and younger ones above that igneous rocks are younger than the rocks they intrude and that folded rocks are formed earlier than the earth movements that fold them. Correlation of a sequence of rocks in one place with those in another is made by fossil faunas and floras. Thus a complete scale of relative ages can be built up stretching back to the first rocks containing fossils (see the table in Part IV). The age in years can, on the other hand, be measured by using radioactive elements (Part II) contained in rocks. If the amount of a radioactive element present is measured and the amount of the product of radioactive decay can also be found, then using the known rates of decay, the time since the product started to accumulate (defined for this purpose as the age in years) can be measured. This method is particularly useful for studying rocks of no great age, fossils (igneous and metamorphic rocks or those too old to contain fossils). By similar methods the age of the earth can be obtained. This turns out to be about 4.75×10^9 years. The rocks containing the first fossils are $2.5-3 \times 10^9$ years old while organised life in abundance first appeared about 0.6×10^9 years ago.

The Continents and the Ocean Floor

The outer part of the earth, namely the asthenosphere and the solid mantle and crust overlying it, the lithosphere, is in a state of restless movement and it is this movement that gives rise to the formation of oceans, continents and mountain belts. The surface of the earth can be divided into a number of rigid plates of lithosphere which move apart or together or slide past one another. Some of these plates are very large, such as the one which contains all of North America, all of

South America, and about half of the Atlantic Ocean. Others are no more than a few thousand square kilometres in size. But they are all moving about relative to one another like ice floes in pack ice. Where two plates move apart hot material rises from the asthenosphere to fill the gap, partly melts and gives rise to a chain of volcanoes and a thin volcanic crust. This is how ocean basins form and grow larger. In the Atlantic the Mid Atlantic Ridge marks the line along which plates are moving apart and where new ocean is being formed. Long narrow pieces of ocean such as the Red Sea and the Gulf of California mark where a continent has just begun to split apart and a new ocean is forming. Where two plates slide past one another a great tear fault results. Such a fault is the San Andreas fault which runs from the Gulf of California to San Francisco. Jerky movement on this fault gave rise to the great San Francisco earthquake of 1906 and could give rise to another earthquake there at any time.

Where two plates move together the result depends on the nature of the crust forming the plates. If at least one of the plates is oceanic the oceanic crust dips down into the mantle and slides away to great depths until it eventually merges with the asthenosphere. Along this dipping sheet of crust strong earthquakes occur and frictional heating of the sheet leads to melting and the production of quantities of lava. Examples of such boundaries are the Andes where the Pacific Ocean dips beneath South America and Indonesia where the Indian Ocean dips below Asia. When both plates are continental on the other hand the crust is too thick and buoyant to slide into the mantle and a collision results giving rise to a fold mountain chain. Eventually the movement grinds to a halt the plates weld together and the fold mountains become dormant. The Himalayas were formed in this way from the recent collision of India and Asia. The evidence

that has led to these conclusions is too complex to summarise here. It comes from a study of rock magnetism, earthquakes, the flow of heat from inside the earth and even from the shapes of the continents that must match across the oceans by which they have been split apart. Confirmation has come from a series of holes drilled in the ocean which has shown how the crust becomes younger towards the centres of the oceans.

Rates of movement of plates have been calculated ranging from a few millimetres a year to ten centimetres a year. The faster movements can be measured directly on the ground by such simple techniques as looking at the displacement of railway lines, walls and roads but the slower ones and those beneath the oceans must be measured by more indirect geophysical methods. The mechanism by which this movement takes place is still unknown. Are the plates pulled by their sinking edges or pushed by their rising edges or moved by some other means? But it cannot be doubted that the movement does happen and that it holds the key to the development of the earth's crust since the time it was first formed. See Plate Tectonics, Part VI.

The Rest

There is a lot more to the study of the earth than has been possible to set down here. The oceans, the atmosphere and the rocks of the crust all interact with one another in their development in a complex way. The surface of the earth has gradually changed as life has evolved over thousands of millions of years and ice ages have come and gone changing the surface again and again. Just as important is the economic potential of the earth on which we depend for all of our energy and all raw materials. This section has given the basic framework within which such further investigations are carried out to help the reader understand as he reads more widely.

II PHYSICS—THE FUNDAMENTAL SCIENCE OF MATTER

WHAT PHYSICS IS ABOUT

Anyone compelled by curiosity or professional interest to look into contemporary journals of pure physics research is soon struck by the fact that the old text book division of physics into heat, light, sound, electricity and magnetism has become very blurred. The indispensable periodical of research summaries *Physics Abstracts* contains about 3 000 entries a month under many separate headings. This is very daunting even to the experienced physicist and as a token of the human effort devoted to one single branch of science it is impressive for variety for degree of specialisation and for sheer volume. How can the main features of this great work be presented to the non-specialist?

Two different though complementary sections can be distinguished. First there is the physics concerned with the properties of matter in bulk with solids, liquids and gases and with those odd but very important substances such as paints, plastic solutions and jelly like material which are neither properly solid nor liquid. In this vast domain of physics questions like these are asked: Why is iron magnetic, copper not? What happens when solids melt? Why do some liquids flow more easily than others? Why do some things conduct electricity well, others badly, some not at all? During the last century particularly the last few decades it has become clear that such questions can be answered only by raising and solving others first. In particular we must ask: (i) Of what nature are the invisible particles of which matter is composed? and (ii) How are those particles arranged in bulk matter?

The first of these two questions has generated the second major category of modern physics: this is the physics of particles and of the forces that particles exert on each other. In this field, which represents science at its most fundamental, questions like these are asked. If matter is com-

posed of small units or particles, what are they like? How many kinds of particle are there? Do the particles possess mass? electric charge? magnetism? How do the particles influence each other? How can their motion be described and predicted?

Once scientists became convinced that matter did indeed consist of particles the arrangement of the particles in matter became an important question. This is the problem of *structure*. It was discovered by von Laue in Germany and by W. H. and W. L. Bragg in England, that the structure of solids could be inferred from the way X-rays are reflected. It is well known that X-rays can penetrate solids. In doing so they encounter successive layers of particles and are reflected from them. The reflections reveal how far apart the layers are and how the particles are arranged in space. This is the technique of X-ray crystallography. By now it has shown that most solid matter is *crystalline* i.e. it consists of a regular pattern of particles repeated over and over again to fill the volume of the solid—just as a wallpaper is covered by repeated units of design. The units in a crystal are very small, often about 10^{-8} cm across and the particles in them are very close together.

Liquids, on the other hand, have no repeated pattern but consist of particles which are jumbled up though still very closely packed—like marbles in a bag. In gases the particles are widely separated and moving rapidly about the average distance between particles in air is about 10 times that in ordinary solids and air particles have an average speed of 5×10^4 cm per sec (1 000 m.p.h.).

In general, therefore, the structure of matter is fairly well understood. This does not mean that structure studies are out of date, but only that now they are devoted to elucidating the structure of particular substances often extremely complex ones such as are found in living matter. We shall therefore say no more about structure.

but turn to the major divisions of physics introduced above (i) particles and their forces (ii) the properties of matter in bulk

PARTICLES AND FORCES

The idea that matter is composed of small particles or atoms originated it is true in classical times. Nevertheless the modern views need be traced back no farther than the beginning of the nineteenth century when Dalton and his contemporaries were studying the laws of chemical combination. By that time the distinctions already made. Compounds and mixtures were substances which can be separated into smaller amounts of chemically distinguishable constituents. Elements (see N34) cannot be so divided. In a mixture the components may be mixed in any proportion and sorted out again by non-chemical means. In a compound the elements are combined in fixed proportions by weight. This last fact gives the clue to atomic theory.

Dalton and Atomic Theory

Dalton pointed out that the fixed combining weights of elements could easily be explained if the elements consisted of atoms which combined in simple numerical ratios e.g. 1 atom of element A with one of B or one of B with two of C and so on. For instance 35.5 g of chlorine combine with 23.0 g of sodium to make 58.5 g of ordinary salt. If we assume one atom of chlorine links with one of sodium then the atoms themselves must have weights in the ratio 35.5 to 23.0. This turns out to be consistent with the combining weights of chlorine and sodium in all other compounds in which they both take part. Sometimes two elements combine in several different proportions by weight. But this is easily explained by assuming that the atoms link up in different numbers e.g. one iron atom with one oxygen or two iron with three oxygens or three iron with four oxygens. Then the three different combining proportions arise from the three different numbers of atoms using in each case the same ratio of oxygen atom weight to iron atom weight.

Atomic Weight

Over the century and a half since Dalton these ideas have been repeatedly tested by chemical experiments. No one now doubts that every chemical element has atoms of characteristic weight. By convention the number 12.0000 is ascribed to carbon and called its atomic weight. The atomic weights of other atoms are expressed by giving their ratio to that of carbon e.g. hydrogen 1.008, iron 55.85. These numbers are only ratios: the real weight of one single oxygen atom is 2.7×10^{-23} g.

J. J. Thomson and the Electron.

Matter is electrically uncharged in its normal state but there exist many well-known ways of producing electric charges and currents—rubbing amber or rotating dynamos for example. It is therefore necessary to have some theory of electricity linked to the theory of matter. The fundamental experiment in this field was made by J. J. Thomson when in 1897 he discovered the electron.

If you take two metal electrodes sealed inside a glass vessel, and if the air is suitably pumped out and a high voltage applied to the electrodes then the negative one emits a radiation which causes the walls of the tube to glow. The rays are called *cathode rays*. The discovery of the electron was essentially a clarification of the nature of cathode rays. Thomson showed that they were streams of particles with mass and negative electric charge and a general behaviour unlike any other atomic particle known at that time. The importance of this discovery for the world of science cannot be overestimated and its technical progeny are in every home and factory in radio valves, television tubes and other devices.

Rutherford-Bohr Atom.

Since the electrons emerge from matter they are presumably parts of atoms. The relation be-

tween the negative electrons and the positively charged constituents of matter was elucidated by the great experimenter Rutherford and the great theoretician Bohr. Their work just before the First World War showed that the positive charge together with almost all the mass is concentrated in the central core or nucleus of the atom about which the very light weight electrons revolve. The diameter of an atom is about 10^{-8} cm, roughly one three hundred millionth part of an inch. The central nucleus has a diameter about 10 000 times smaller still. The nucleus and the electrons hold together because of the electric attraction between them.

At this stage work could and did go on separately along several different lines.

(i) Electrons could be studied on their own. Nowadays the handling of beams of electrons of all sizes and intensities has become a major industry.

(ii) The nucleus could be treated as a special problem and this led to the mid-century flowering of nuclear physics to the atomic bomb and to nuclear power.

(iii) The behaviour of electrons in the atom could be analysed: this is the great domain of atomic physics which spreads into many other sciences as well.

Volumes have been written about each of these three fields but we can spare only a few lines for each.

The Electron

Electrons are expelled from solids by light, heat, electric fields and other influences. It has therefore been possible to study beams of electrons on their own *in vacuo*. Electrons inside matter either as constituents or temporarily in transit can also be observed by their innumerable effects. These observations all show the particles to be indistinguishable one from another: all electrons are the same wherever they come from. They have a definite mass (9.11×10^{-31} g) a negative electric charge, a magnetic moment and a spin (intrinsic rotatory motion). No one has ever subdivided an electron or obtained an electric charge smaller than that on one electron. The electronic charge is therefore used as a basic unit of charge in atomic physics. The electron has come to be the best known of all the fundamental particles.

The Nucleus

The early research programmes in nuclear physics were greatly facilitated by the occurrence in nature of certain unstable (radioactive) nuclei which emit fast moving fragments. The latter can be used as projectiles to aim at other nuclei as targets: the resulting impacts yield much valuable information. This technique still dominates nuclear physics though nowadays the projectiles are artificially accelerated by one or other of the large costly machines designed for the purpose.

The most important early discovery was that the nucleus consists of two types of fundamental particle—the positively charged *proton* and the electrically neutral *neutron*. These two are of nearly equal mass (about 1 800 times that of the electron) and like electrons have a magnetic moment and spin. The proton charge is equal to the electron charge though opposite in sign. Consider a moderately complex nucleus like that of iron. This usually has 30 neutrons and 26 protons. Its atomic weight therefore depends on the total number of neutrons plus protons, but the total charge depends only on the number of protons—called the *atomic number*. The latter is denoted by *Z* while the total number of neutrons plus protons is called *mass number* and denoted by *M*. A species of nucleus with given values of *Z* and *M* is called a *nucleide*. *Z* is also the number of electrons in the atom since the atom as a whole is electrically neutral. The atomic number determines the chemical nature of the atom (see below) so that by altering the number of neutrons in a nucleus we do not change the chemical species. It is therefore possible to find—and nowadays to

make—nuclei of the same element which nevertheless differ slightly in weight because they have different numbers of neutrons. These are called *isotopes*. Iron isotopes are known with 26 27 28 29 30 31 32 and 33 neutrons but all have 26 protons. Thus a set of isotopes consists of the various nuclides that have the same Z but different M s.

Stable Nuclides

The protons and neutrons in a nucleus are bound together by strong forces called *nuclear forces*. In many cases the forces are so strong that no particles ever escape and the nucleus preserves its identity. There are two hundred and seventy four different combinations of neutrons and protons of this kind and they are called the *stable nuclides*. The earth is largely composed of such stable nuclides because any unstable ones have in the course of time spontaneously broken up into stable residues.

Nevertheless there are some unstable nuclei left on earth. They give rise to the phenomenon of radioactivity which was discovered by Becquerel in 1893.

Unstable Nuclides Radioactivity

Becquerel found that certain chemicals containing uranium gave off rays capable of blackening a photographic plate and shortly afterwards Marie and Pierre Curie discovered more substances including radium which produce similar but stronger effects. By now about fifty chemical elements having radioactive properties are known to exist on earth some like radium, being strongly radioactive, others like potassium, being so weak that the radiations are difficult to detect. These are called the *natural radioactive nuclides*.

The main facts about radioactivity are as follows: it is a nuclear phenomenon and (with minor exceptions) proceeds quite independently of whatever the electrons in the atom may be doing. Thus the radioactivity of an atom is not affected by the chemical combination of the atom with other atoms nor by ordinary physical influences like temperature and pressure. The radioactivity consists of the emission by the substance of certain kinds of rays. The early workers, Rutherford being the giant among them, distinguished three kinds of rays labelled α , β and γ . These are described below. Whatever kind of ray is examined it is found that the radiation from a given sample decreases gradually with time according to a definite law which states that the intensity of radiation decreases by half every T seconds. The number T called the half life is constant for each radioactive material but varies enormously from substance to substance. For instance radium decreases its activity by a half every 1 622 years whereas the half life of one of the polonium isotopes is about 0.3×10^{-6} sec.

α , β , and γ rays.

The three most well known types of radioactive emission are quite distinct from one another.

(i) α rays or α particles consist of two protons and two neutrons bound together. They are ejected from the radioactive nucleus with one of several well defined speeds. These speeds are high often of the order 10^8 cm per sec. Two protons and two neutrons are the constituents of the nucleus of helium, and α particles are thus fast moving helium nuclei.

(ii) β rays are moving electrons. They may emerge from their parent nucleus with any speed from zero to a definite maximum. The maximum speed often approaches that of light, and is different for each isotope. The electron has a positively charged counterpart the positron (see below) and β rays are sometimes positrons. To distinguish the two cases the symbols β^- and β^+ are used. The naturally occurring β radiations are almost all β^- .

(iii) γ rays travel with the speed of light because they are in fact electromagnetic waves differing from light only in the extreme shortness of their wavelength. They have no electric charge.

It is unusual though not unheard of, for the same radioactive substance to emit both α and

β rays. On the other hand γ rays frequently accompany either α or β rays.

γ rays pass through matter easily in fact they are extra penetrating. X rays, α rays can be stopped by thin sheets of tissue paper, α rays brought to rest pick up a pair of electrons from the surrounding matter and become neutral helium atoms and helium gas from this source is consequently found imprisoned in certain radioactive rocks. β rays are intermediate in penetrating power between α and γ rays.

We must now try to interpret these observations.

Radioactive Disintegration

A nucleus is a collection of neutrons and protons interacting with each other and possessing collectively a certain amount of energy. Just as some human organisations lose their coherence if they accept too many members so nuclei can remain stable only if (i) the total number of particles is not too great and (ii) neutrons and protons are there in suitable proportions. Radioactive nuclei are the ones for which either or both these conditions do not hold. Sooner or later such nuclei eject a fragment thus getting rid of some energy they cannot contain. This is called a *radioactive disintegration* and the fragments are the α , β and γ rays. α emission reduces a nucleus of two neutrons and two protons and some energy. γ -emission simply carries off excess energy without altering the number or kind of particles left behind. β -emission is more complicated. There are no electrons normally present in a nucleus but they are suddenly created and explosively emitted if a neutron changes into a proton. Positive electrons are similarly generated if a proton changes into a neutron. β emission is therefore a mechanism for changing the ratio of protons to neutrons without altering the total number of particles.

Both α and β emission change the Z of a nucleus and the product or daughter nucleus is a different chemical element. α emission also changes the M . It might happen that the daughter nucleus is unstable in which case it too will disintegrate. Successive generations are produced until a stable one is reached. Part of such a family tree is shown below. The symbols above the arrows show the kind of rays emitted at each stage the figures are the mass numbers M and the names and symbols of chemical elements can be found at the end of the Section F66.

This family exists naturally on earth because the head of the family U^{238} has so long a half life (4.5×10^9 years) that there has not yet been time enough since its formation for it to have disappeared.

Artificial Radioactivity

Nowadays many new radioactive isotopes can be man made. All that is required is to alter the M or Z (or both) of a stable isotope to a value which is incompatible with stability. The means for doing this is bombardment, i.e. stable nuclei are exposed to the impacts of atomic particles such as streams of protons from an accelerator or neutrons in an atomic reactor or simply the α particles from another radioactive substance. The new material is called an *artificially radioactive isotope*. Artificial radioactivity is not different in kind from that of the naturally radioactive substances but the half lives are usually on the short side. Indeed the isotopes in question would exist in nature but for the fact that their short half lives ensured their disappearance from the earth long ago.

Suppose a piece of copper is exposed to the intense neutron radiation in an atomic reactor at Harwell.

The more abundant of the two stable isotopes of ordinary copper has thirty four neutrons and twenty nine protons (i.e. $Z = 29$, $M = 63$). In the reactor many (not all) of these nuclei absorb a neutron giving an unstable copper nucleus with $Z = 29$, $M = 64$. When removed from the reactor the specimen is observed to be radioactive with a half life of 12.8 hours. It is somewhat unusual in that it gives out both β^- and β^+ rays. Some nuclei emit electrons leaving a daughter nucleus with one more positive charge than copper (i.e. γ zinc nucleus ($Z = 30$, $M = 64$)). One neutron has become a proton and the result... zinc nucleus is stable. The others emit positrons leaving behind a nucleus in which a proton has been turned into a neutron ($Z = 28$, $M = 64$) this is a stable nickel nucleus. The overall process is one example of the artificial transmutation of the chemical elements which is now a commonplace of nuclear physics. It was first discovered by Irene and Frederick Joliot Curie in 1934.

Lack of a Complete Theory

Consider now a collection of say one million radioactive nuclei of the same kind. It is impossible to tell exactly when any one of them will disintegrate: it is a matter of chance which ones break up first. All we know is that after a time equal to the half life, only a half a million will survive unchanged. In general the more excess energy a nucleus has the more likely it is to break up and therefore the shorter the half life of that particular nuclear species. In principle to calculate the half life theoretically one would have to have a reliable theory of nuclear forces and energies. This is still being sought after so it is probably fair to say that while the laws of behaviour of radioactive isotopes are well and accurately known the *explanation* of this behaviour in terms of the properties of protons and neutrons is by no means complete.

Nuclear Fission—Chain Reaction

A discovery important not just for nuclear physics but for the whole of mankind was made by Hahn and Strassman in 1939. This was the discovery of nuclear fission in uranium. One of the natural isotopes of uranium is an unstable one U^{235} with 143 neutrons and 92 protons. It normally shows its instability by emitting α and γ rays. If uranium is bombarded with neutrons some U^{235} nuclei temporarily gain an extra neutron which makes them even less stable. This they show by splitting into two roughly equal parts called fission fragments together with two or three neutrons. There are two highly important things about this disintegration. One is that the two or three neutrons can promote further disintegrations in other uranium nuclei and the process can therefore be self propagating. It is then called a *chain reaction*. The other is that the total mass of the fission products is less than that of the original nucleus. This mass difference does not disappear without trace: it turns into energy according to a formula referred to in a paragraph below (F15(1)).

Application of these New Forces

The world has found two uses for the energy liberated in nuclear chain reactions: the atomic bomb and nuclear power plants. In the first conditions are arranged to promote and encourage a tremendous and rapid chain reaction leading to an explosion; in the second, the steady liberation of energy in the form of heat is controlled for use in turbines which can generate electricity or provide propulsion. Both uses represent epoch making technical achievements but mankind has yet to show itself capable of bearing sanely the burden of responsibility which nuclear physicists have laid upon it. One thing is certain: the discoveries will not cease. Already other fissionable elements have been made and used: new chemical elements have been created: nuclear plants (atomic piles) have stimulated great demands for new materials that will stand the heat and radiation inside the reactor and this promotes research in other fields of science. Irradiation inside an atomic pile gives new and potentially useful properties to old materials.

nuclear power drives ships and submarines. It is difficult to write even briefly about contemporary nuclear physics without feeling keenly the ambiguity of its powerful promises.

Although so much is known about the behaviour of nuclei the theory of the nucleus leaves much to be desired. What holds the neutrons and protons together? Why are some nuclei more stable than others? It is certain that the forces between neutrons and protons in a nucleus are unlike the electrical attractions between the nucleus as a whole and its surrounding electrons. Nor have they anything to do with gravitation. Indeed the best description and explanation of nuclear forces is the objective of much of the contemporary research effort in nuclear physics.

Atoms

A nucleus surrounded by its full complement of electrons is an electrically neutral system called an atom. Neither the atom as a whole nor its nucleus counts as a fundamental particle because either can be subdivided into more elementary parts thus:

The chemical identity of the atoms of a given element which was Dalton's key idea depends entirely on the number and motion of the electrons. For example the simplest element, hydrogen has one proton for a nucleus and one electron. The latter is comparatively easily detached or disturbed by the electric forces exerted by neighbouring atoms consequently hydrogen is reactive chemically: it readily lends its electron to build chemical structures with other equally co-operative elements. The second element, helium has a nucleus of two protons and two neutrons; outside are two electrons in a particularly stable arrangement. Indeed this pair of electrons is so difficult to disarrange that a special name has been coined to cover such cases—*closed shells*. Helium, with its closed shell will not react chemically with anything. As the nuclear charge increases different electron arrangements of greater or lesser stability succeed one another with every so often a closed shell corresponding to one of the chemically inert gases: neon, argon, xenon, krypton. See F20 (1).

Such considerations pursued in sufficient detail enable atomic physicists to account for all the differences and similarities among the chemical elements and in principle at least for the other facts of chemistry as well.

Ions

It is possible to remove one or more electrons from an atom leaving it positively charged. The atom is then said to be *ionised* and is called a *positive ion*. Alternatively some atoms are capable of accepting electrons above their normal complement thus becoming negative ions. The behaviour of ions is very important in many fields of physics and chemistry and some of these will be referred to later.

Molecules

Electrical attractions of various kinds cause atoms and ions to form compound groups. This is the basis of chemical combination and the smallest conceivable fragment of compound which still preserves the chemical identity of that compound is called a molecule. Molecules have a wide range of complexity: from simple pairs of atoms to highly intricate spirals and chains composed of thousands of atoms. See Part III.

Excited Atoms

Like the nuclei described above atoms can be given excess energy and will then return to their ground state with the emission of radiation. The excess energy usually resides in one of the electrons which is executing unusually violent motion. The electron returns to normal by releasing its excess energy in the form of light whose colour is characteristic of the atom involved.

Herein lies the explanation of innumerable natural and technical phenomena such as the colours of glowing gases whether they exist in the sun and stars in aurorae or in street lamps and neon signs. Herein also lies the reason for the importance of spectroscopy which is the study of the characteristic radiation from excited atoms for spectroscopy is not only a useful tool for the chemical identification of elements (spectroscopic analysis) but was one of the main routes along which twentieth century physicists broke through to a knowledge of the inner nature of the atom.

Maxwell and Electromagnetic Waves

Atoms are held together by the electric attraction of the nucleus for the electrons. Inner details of atomic behaviour depend on the magnetic moments of the particles. Any region of space subject to electric and magnetic influences is called an *electromagnetic field*. Before the discovery of the electron Maxwell had perfected a general theory of the electromagnetic field giving to physics a celebrated set of equations which describe satisfactorily almost all electric and magnetic phenomena. *Inter alia* he proved that disturbances in the electric and magnetic conditions at one place could be propagated to another place through empty space with a definite velocity just as sound waves are propagated through air. Such electromagnetic disturbances in transit are called *electromagnetic waves* and their velocity turned out experimentally to be the same as that of light and radio waves—which was a decisive argument to show that both of these phenomena are themselves electromagnetic waves.

Einstein and Photons

In the years between about 1900 and 1920 this view was upset by Planck, Einstein, Millikan and others who focused attention on phenomena (radiant heat, photoelectricity) in which light behaves like a stream of particles and not at all like waves. A wave and a particle are two quite different things as anyone will admit after a moment's contemplation of say the ripples on a pond and a floating tennis ball. The acute question was: is light like waves or particles? This celebrated dilemma soon multiplied its horns. In 1927 electrons were shown to be quite capable of behaving as waves instead of particles, and this is now known to be true of protons, neutrons and all other fundamental particles as well.

Theoretical physicists have devised means of having it both ways. To say that light behaves as particles means that the waves of the electromagnetic field cannot have their energy subdivided indefinitely. For waves of a given frequency there is a certain irreducible quantity of energy that must be involved whenever light interacts with anything. This quantity is the product $h\nu$ where ν is the frequency and h is a constant named after Planck. Each such unit is called a *quantum of the electromagnetic field* or a *photon* and is counted as one of the fundamental particles. Frequencies and wavelengths vary widely: typical wavelengths are radio—hundreds or thousands of metres, radar—a few centimetres, visible light— 5×10^{-7} cm, X-rays— 10^{-8} cm.

Elementary Particles

Nature seems to use four different kinds of force to make one particle interact with another. The weakest force is gravity while this dominates celestial mechanics its effect inside atoms is negligible compared with the other three. The binding forces inside atoms are *electromagnetic* e.g. the attraction of nuclei for electrons. Considerably stronger still is the nuclear force which holds the nuclei together and this is called the *strong interaction*. The fourth force is called the *weak interaction* and is intermediate in strength between electromagnetic and gravitational forces. It is responsible for a number of phenomena of which the best known is β radioactivity.

G (80th Ed.)

Particles may respond to some or all of the forces. Protons are involved with all of them but electrons respond to all except the strong interaction. When new particles are discovered physicists try to find out their fundamental properties and among these is their response (if any) to each kind of force. Some other basic properties are electric charge (if any), mass (if any) and the speed with which the particle splits up spontaneously into other types.

So many so-called elementary particles have been discovered (about a hundred) that the whole conception of elementaryness has been in question. Are all the particles equally elementary? Are some of them excited states or combinations of others? When a family reaches a hundred it becomes difficult to believe they are all grandparents. One current trend is away from setting up a hierarchy in which some particles are elementary and some composite and towards treating them all as mutually dependent for their existence. This however is a very difficult problem not yet solved.

A few particles are stable but most decay into products. The lifetimes of unstable particles are extraordinarily short by everyday standards but even so some (of about 10^{-17} sec or upwards) are much longer than others (of about 10^{-23} sec). The Table on page F14 contains the stable particles and a selection of the moderately unstable ones with brief comments on their properties.

The Table shows a rudimentary classification into four groups: (i) the photons, (ii) leptons—which are particles lighter than protons which do not react to the strong type of force, (iii) mesons—which are particles lighter than protons which are subject to all the kinds of force, (iv) baryons—which include protons, neutrons and heavier particles all of which react to the strong force. Many of these particles have been produced for the first time in recent years by bombarding matter with beams of high energy particles. Much of this work is done in the large accelerating machines at Brookhaven, New York and the European Organisation for Nuclear Research, Geneva.

Forming particles into groups is an important matter. It is comparable with arranging chemical elements into the Periodic Table. The pattern does not of itself explain anything but it strongly suggests where to look for explanations. The classification of particles currently favoured is based on the very sophisticated mathematical ideas known as *group theory*. Group theory is a branch of mathematics which is finding increasing application in physics and it had a resounding success recently which illustrates the value of grouping. It turned out that there was no known particle to occupy a vacant position in one of the family groups required by the theory. This particle the omega minus was sought and found with exactly the right properties in February 1964. This is reminiscent of finding the missing elements in the Periodic Table. The discovery of omega minus generated much excitement in the scientific world and many physicists believe that a new and deeper understanding of fundamental physics is just round the corner. The corner may be turned if three much sought after but as yet undiscovered particles called the quarks are found. Some theoreticians believe that the properties of all other particles could be explained by the behaviour of the three really fundamental quarks. The latter are hypothetical but are being taken very seriously by those who are trying to detect them experimentally.

It is now accepted that every fundamental particle is a manifestation of the waves of one or other kind of field. Physicists speak of waves, particles and fields in the same breath or rather the same equation. Little is to be gained by asking if electrons or photons are really particles or waves. All one can say is that they are things whose behaviour is predicted and described by certain equations. Those who must visualise can imagine particles in some phenomena and waves in others. Neither conception contains the whole truth. Why should the ultimate invisible constituents of matter be forced into one or other category derived from everyday experience? For convenience, however, we shall continue to call these things 'elementary particles.'

SOME MEMBERS OF THE ATOMIC FAMILY

The numbers in brackets after the name denote first the electric charge and second the mass. The charge on an electron is counted as -1 unit and the electron mass as $+1$ unit. Thus $(+1\ 207)$ means the particle has a positive charge of 1 unit and a mass 207 times that of the electron.

Photon (0 0)	A quantum of electromagnetic radiation <i>e.g.</i> light X rays γ rays. The concept was introduced by M. Planck in 1900 when he described the emission of light as taking place in "packets" rather than in a steady stream. The energy of a photon is proportional to the frequency of the radiation and inversely proportional to the wavelength.
<i>Leptons</i>	
Electron ($-1\ 1$)	Discovered by J. J. Thomson in 1897. The number of orbital electrons in an atom determine its chemical properties. Actual rest mass = 9.1×10^{-28} g. Emitted as β rays by some radioactive nuclei. A stable particle.
Positron ($+1\ 1$)	Positive counterpart or "anti particle" to the electron. Predicted theoretically by P. A. M. Dirac in 1928 and first discovered in cosmic rays by C. D. Anderson in 1932. Emitted as β rays by some radioactive nuclei. When positrons and electrons collide they usually annihilate each other and turn into γ rays, consequently positrons only last about 10^{-10} sec. within ordinary matter, but are stable in isolation.
Neutrino (0 0) and Anti neutrino (0 0)	These particles travel with the speed of light and are distinguished from one another by the relation of their spin to their direction of motion. A neutrino is emitted with the positron during positive β decay, and an anti neutrino with the electron during negative β decay. Their interaction with matter is extremely slight. First postulated by Pauli in 1933 and detected in 1956. π meson decay also produces neutrinos and anti neutrinos but in 1962 it was proved experimentally that these are a different species. Thus there are two kinds of neutrino each with an anti neutrino. All these particles are distinguished from photons by having different spin.
Muon ($\pm 1\ 207$)	Similar to but heavier than the electron and positron. Disintegrates into electron (or positron if positive) + neutrino + anti neutrino.
<i>Mesons</i>	
Pion ($\pm 1\ 273$) or (0 264)	The π meson. Charged pions decay either into muons and neutrinos or into electrons and neutrinos. Neutral pions decay into γ rays into positron-electron pairs, or both. Pions are intimately connected with nuclear forces <i>i.e.</i> with the strong interaction.
Kaon ($\pm 1\ 967$) or (0 974)	The K mesons. These decay in many different ways producing other mesons, electrons and neutrinos.
<i>Baryons</i>	
Proton ($+1\ 1836\ 1$)	The positively charged constituent of nuclei. The hydrogen nucleus is one proton. Fast moving protons occur in cosmic rays. Does not spontaneously disintegrate.
Anti proton ($-1\ 1836\ 1$)	Negative anti particle of the proton. Its existence was long suspected. Artificially produced and detected for the first time in 1955. Will react with the proton to produce pions or kaons.
Neutron (0 1838 6)	Discovered by J. Chadwick in 1932. The neutral constituent of nuclei. When free it spontaneously disintegrates into a proton, an electron, and an anti neutrino after an average lifetime of about 18 minutes. Passes through matter much more easily than charged particles.
Anti neutron (0 1838 6)	The anti particle of the neutron from which it is distinguished by properties connected with its magnetic moment and spin. Will react with neutron to produce pions or kaons.
Lambda Particle (0 2188)	Discovered in 1947. Decays into proton plus pion.
Sigma Particle (0 or ± 1 about 2380)	Various modes of disintegration producing neutrons, protons, mesons and lambda particles.
Omega Minus ($-1\ 3270$)	Predicted by recent theory and discovered at Brookhaven, New York in 1964. Still under intensive study.

QUANTUM THEORY AND RELATIVITY

Quantum Theory

The point of view of the last paragraph is characteristic of quantum theory which is the currently accepted fundamental theory of matter and motion. One can reasonably ask at what position in space, exactly, is a particle? Or what exactly is the wavelength of a wave? But the first ques-

tion cannot be reasonably asked of a wave nor the second of a particle. Since electrons have something in common with both, one question cannot be answered precisely for electrons without ignoring the other. Alternatively, both questions can be given an imprecise answer. As the wavelength of electrons is intimately connected with their speed, one has to accept an accurate knowledge of the speed (wavelength) and ignorance of

position or the converse or *inaccurate* knowledge of both. This is the famous Heisenberg Uncertainty Principle. Quantum theory is a set of mathematical rules for calculating the behaviour of fundamental particles in accordance with the Uncertainty Principle. In spite of its equivocal sounding name the principle has led to an enormous increase in the accuracy with which physical phenomena can be described and predicted. Quantum theory includes all that previous theories did and more.

Quantum theory grew up in the same epoch as the Theory of Relativity. Heroic attempts have been made to combine the two but with only partial success so far. Relativity is concerned with all motion and all physical laws but its characteristic manifestations occur only when something is moving with nearly the velocity of light. Quantum theory is likewise all embracing but its typical phenomena almost always occur when something on the minute atomic scale is in question. Consequently the vast majority of everyday mechanics needs no more than the classical theory laid down by Newton which is neither relativistic nor quantum.

Relativity

Historically relativity grew out of attempts to measure the speed with which the earth moved through that hypothetical medium called the ether which was supposed at that time to be the bearer of light waves. To take a simple analogy sound waves travel through still air with a certain definite speed v . If you move through the air with speed v towards oncoming sound waves they will pass you at the speed $v + v$. Michelson and Morley in their celebrated experiment of 1887 failed to find the corresponding behaviour on the part of light. This is so important an experiment that it has been repeated and repeatedly discussed ever since. In October 1958 the latest and most accurate confirmation of the Michelson-Morley result was announced. It seems as if light always travels with the same speed relative to an observer however fast he moves relative to any thing else. Einstein put it this way: two observers moving with any constant velocity relative to each other will always agree that light travels past them at the same speed. This speed is denoted by c and is approximately 180 000 miles per second.

This postulate logically developed leads to remarkable conclusions. For instance if you walk from tail to nose of an aircraft at 4 m.p.h. and the plane is receding from me at 300 m.p.h. then you recede from me at 304 m.p.h. Common sense. Newton and Einstein would all agree on this. But if you could walk at 0.26c and the plane moved at 0.5c the Newtonian mechanics would give your recession speed as 0.75c whereas Einsteinian relativity would give about 0.71c. Although at the everyday speed of 300 m.p.h. the disagreement though present in principle is absolutely negligible at speeds near that of light it becomes very pronounced. Many experiments show that the relativity answer is right.

Equivalence of mass and energy

Another famous consequence of relativity is the equation $E = mc^2$ connecting energy E with mass m . c is so great that when mass is converted to energy a small mass gives a large energy. The grim demonstration of this was given to the world at Hiroshima, a more hopeful one at Calder Hall, the world's first nuclear power station. The life giving energy of the sun is derived from nuclear processes which consume mass and deliver energy according to this equation.

Mass and rest mass

Mass is far from being a simple notion. The only complication we shall note here is that the mass of a body is not necessarily constant. A stationary body can be observed to have a mass called its *rest mass*. If the body moves it has energy of motion and therefore according to Einstein's mass-energy equation, it increases its mass. Mass thus depends on speed but in such

a way that there is very little change unless the speed approaches that of light. Many experiments on atomic particles demonstrate this. The interesting question now arises: do all fundamental particles have rest mass? or do some have mass derived solely from their energy? The answer appears to be that photons and neutrinos have no rest mass, all other particles have. The Table on F14 gives their rest masses.

Special theory of relativity

The mathematical development of Einstein's ideas leading to the conclusions just referred to constitutes the Special Theory of Relativity. Stated more generally the theory raises the question whether two observers in uniform relative motion could ever detect as a result of their relative speed any difference in the physical laws governing matter motion and light. To this Special Relativity answers: No. The detailed theory involves special consideration of the results the two observers would obtain when measuring (i) the spatial distance and (ii) the time interval between the same two events. It turns out that they would not agree on these two points. They would agree however on the value of a certain quantity made up jointly of the spatial distance and the time interval in a somewhat complex combination. The intimate mixture of space and time in this quantity has led to the treatment of the three space dimensions and time on an equivalent footing. Hence the frequent references to time as the fourth dimension. Minkowski devised an extremely elegant presentation of relativity theory by using an extension of ordinary geometry to four dimensions. A line drawn in his four dimensional space represents the path of a particle in space and time, i.e. the whole history of the particle. Thus the movement of particles in the ordinary world is turned into the geometry of lines in Minkowski's four dimensional world of space-time.

Relativity and Gravitation.

The apparently innocuous extension of the preceding ideas to include observers in accelerated relative motion opened up new fields of mathematical complexity but enabled Einstein to bring gravitation into the argument. In speaking of atoms and particles we have not yet mentioned gravity. This is because the electrical and magnetic forces acting between the particles constituting matter are much stronger than the gravitational gravity need not enter atomic theory at all. But in the discussion of astronomical problems and the movement of large scale electrically uncharged bodies it has been usual ever since Newton to say that two bodies of mass m_1 and m_2 separated by a distance r attract one another with a force proportional to $m_1 m_2 / r^2$. This is Newton's inverse square law of gravitation. With this Newton explained the movements of planets and comets and the falling to earth of the apple from his tree.

The apple's fall is accelerated and we observe this by noting its position relative to certain marks fixed with respect to us and by timing it with some sort of clock. This system of location in space and time may be called our frame of reference. We therefore assert that in our frame of reference the apple falls down with an acceleration which Newton saw no alternative but to attribute to a thing called gravitational attraction. Galileo had shown that all bodies fall with the same acceleration at all points and we can now rephrase this by saying that in our frame of reference there is a constant gravitational attraction or *uniform gravitational field*. (This last statement and Galileo's demonstration only refer strictly to points fairly near the earth's surface at greater distances the gravitational field decreases and is therefore not uniform.)

Now suppose a collection of falling bodies is observed by an intelligent creature designated C who inhabits one of them. C has his own frame of reference fixed relative to him. In C 's frame neither his own body nor any of the others, is accelerated and therefore he has no reason to

suppose a gravitational force is acting on them. We have therefore the following situation

(i) in our frame fixed relative to us we find all the bodies falling subject to a gravitational pull

(ii) in C 's frame undergoing accelerated fall relative to us no gravitational field is apparent

It looks therefore as if one has only to choose the correct frame of reference for the measurements in order to remove the need for any assumptions about the existence of gravitational fields. This is a simple illustration of the connection between gravitation and frames of reference for the measurement of space and time. Einstein's General Theory of Relativity extends this to cover non uniform gravitational fields and shows that what Newton taught us to call the gravitational field of material bodies is better thought of as a peculiarity of the space and time in the neighbourhood of such bodies. Since space-time as we mentioned above can be expressed in geometrical terms Einstein has transformed the theory of gravitation into an exercise (a difficult one) in the geometry of space-time. Other physicists in Einstein's tradition are trying to turn all physics into geometry but no one knows whether this is really feasible.

All this abstruse work is much more than a demonstration of mathematical power and elegance. Observable phenomena which fall outside the scope of Newton's theory of gravitation are accounted for by relativity. One is the small but definite discrepancy between the actual orbit of the planet Mercury and the predictions of Newton's theory. Another is the bending of stellar light rays as they pass close to the sun, an effect which results in the apparent displacement of the position of the star. A third is the effect of a gravitational field on the wave length of light emitted by atoms. Similar atoms in different places in a gravitational field emit radiations with slightly different wavelengths. For example the light from an atom in the intense field of a star should have slightly longer wave length than the corresponding light from an atom on earth. This effect has always proved very difficult to detect with certainty. However Einstein's prediction was verified with moderate accuracy in 1960 by a very subtle method which was purely terrestrial in its operation. The atoms being compared were placed at the top and bottom of a water tower and the difference in their emission was detected by means that belong rather to nuclear physics than to astronomy.

Quantum Theory and Relativity Combined

The atomic family table refers to antiparticles. The theory which first introduced such notions in 1934 is due to the Cambridge physicist Dirac and was epoch making. Dirac conceived an equation to describe the motion of electrons subject to the laws of both quantum theory and relativity. His achievement was thus to synthesize these two great ideas. The spin of the electron was originally a supposition that helped to make sense of spectroscopic observations of light emitted from atoms. Dirac's equation made spin a logical consequence of the union of relativity and quantum theory. Perhaps even more important was the brilliant inference that the equation for the electron implied the existence of another particle having the same mass and spin but with a positive instead of a negative electric charge. This object is called the electron's anti-particle and is now well known as a positron.

A positron and electron can be created simultaneously (pair production) and can annihilate each other when they collide.

Every particle is now believed to imply an anti-particle, so it is conceivable that the universe could have been (but isn't) an anti-universe, i.e. all the electrons and protons might have been positrons and antiprotons and so on. The laws of physics would still have been applicable however.

Not all particles are charged electrically but when they are, their antiparticles have equal charges of the opposite sign. Whenever charged

particles interact the total amount of electric charge is the same before and after whatever events occur. This is called the law of conservation of charge.

Conservation Laws

Parity. Charge conservation and the conservation of energy (F 17(2)) are only two of a considerable number of conservation laws. Readers who have studied mechanics will also be aware of the conservation of momentum and of angular momentum. A conservation law is the proposition that in the course of physical happenings such and such a quantity is conserved, i.e. maintains a constant value.

The establishment of conservation laws is playing a great part in our growing understanding of elementary particles although the things that are conserved are somewhat abstruse. One of them is called parity.

Any reader who looks in a mirror knows that the left and right hand sides of his face are interchanged in the image. Fortunately mirrors do not also turn the image upside down but if they did the face would then have undergone what is called a parity transformation. A screwdriver driving a right handed screw downwards becomes on parity transformation a screwdriver driving a left handed screw upwards. The law of conservation of parity is a way of asserting that any physical process that goes on in the world could equally well go on—obeying the same laws—in a parity transformed world. There is nothing left handed that does not in principle have a right handed counterpart.

For many years this belief was strongly held. It came as something of a shock when in 1957 after theoretical proposals by Lee and Yang in America Wu and co-workers proved that parity was not always conserved. To understand Wu's experiment we must recall that nuclei can have intrinsic spin. Suppose the axis of spin were downwards into the page and the rotation were suitable for driving an ordinary screw into the page. Then Wu showed that beta rays from such a nucleus are emitted *preferentially upwards*, i.e. against the direction of travel of the screw. The parity transformed version of this would have the beta rays preferentially emitted in the same direction as the travel of the screw and if parity is conserved this process would happen too. But it does not. If the beta rays in the experiment had been emitted in equal numbers up and down, then the parity transformed version would have had this feature too and thus parity would have been conserved.

Of the four types of force referred to on F 13(1) only the weak interaction does not conserve parity. The whole matter is bound up with the anti-neutrino which is emitted simultaneously with the negative beta ray. It appears that antineutrinos are always right handed, which means that if one could look at an antineutrino receding from us it would be seen to be spinning clockwise.

Modern research on elementary particles is greatly concerned to find out which types of process obey which conservation laws. The parity surprise is only one of the stimulating shocks that this type of work is heir to. It is very much in the tradition of Einstein part of whose monumental contribution to physics was his demonstration of the need to analyse conservation laws.

Conclusion

Over a century's development of the atomic ideas has brought a progressive if jerky increase in the mathematical precision of the theories. In some fields of particle physics observations to one part in a million or even better can be explained, to that level of accuracy by the existing theories. At the same time however the theories have lost visual definition. An atom as an invisible but none the less solid billiard ball was easy enough so was a light wave conceived like a sound wave in air. Even after Rutherford, an atom consisting of a miniature solar system merely exchanged the solid billiard ball for a system of revolving billiard balls and was no great obstacle to visualisation. But since quantum

theory and the Uncertainty Principle every unambiguous visualisation of fundamental wave particles leaves out half the picture and although the electrons are in the atom we can no longer represent them in definite orbits. The moral seems to be that visualisation is unnecessary or at best a partial aid to thought. All the theoretical knowledge is in the equations and these are very precise. Hence the non-physicists grumble—that physics is too mathematical these days—has some justification and hence also the growing distinction in physics between the theoreticians who are usually mathematically trained and the experimenters who can rarely read the papers their theoretical colleagues write but provide the results for them to write about.

THE PROPERTIES OF MATTER IN BULK.

One of the most obvious and at the same time most wonderful things about the properties of matter is their great variety. Think of air, diamond, mercury, rubber, snow, gold, pitch, asbestos. Even the differences of state of the same chemical substance are remarkable enough: ice, water and steam, for example. One of the aims of physics is to reach an understanding of all these different properties by explaining them in terms of the behaviour of the particles discussed in the previous section (§9-17). The widespread success with which this imposing programme has been carried out indicates the maturity of physics. It is difficult to think of any major property of matter in bulk for which there is not some attempted theoretical explanation though future physicists will no doubt regard some present day theories as rudimentary or incorrect.

Physics Statistics and Thermodynamics.

Take a number equal to the population of London multiply it by itself and multiply the product by another million. The answer is about the number of molecules in 1 cubic centimetre of ordinary air. They are constantly moving about and colliding with one another. Even if the nature of the molecules and their laws of motion were perfectly understood it would clearly be impracticable to calculate the exact paths described by each particle of so vast an assembly. This difficulty brought into being a whole branch of physics concerned with calculating the overall or average properties of large numbers of particles. Just as statisticians will provide the average height, income, expectation of life and so on, of the population of London, without knowing everything about every individual, so statistical physicists can work out average properties of molecules or atoms in large groups. This important branch of physics is called *Statistical Mechanics*. It was founded in the nineteenth century by Maxwell, Boltzmann and Gibbs and is still being actively developed.

Consider now all the molecules in 1 cubic centimetre of air contained in a small box. They are continually bombarding the walls of the box and bouncing off. This hail of impacts (it is actually about 10^{18} impacts per square centimetre per second) is the cause of the pressure which the gas exerts against the walls of the box. Now suppose we pump air in until there is twice as much as before though the box is still the same size and at the same temperature. This means that the density of the gas (i.e. the mass of 1 unit of volume) has doubled. We should now expect twice as many impacts per second on the walls as before, and consequently twice the pressure. We therefore arrive at a conclusion that if the volume and temperature are constant the pressure of a gas is proportional to its density. This is one of the simplest statistical arguments that can be checked against observation in fact it stands the test very well.

Heat, temperature and energy

The proviso about the temperature remaining the same is an important one for the following reason. In the nineteenth century there was

much discussion about the nature of heat. To Joule we owe the now well established view that heat is equivalent to mechanical work. In one of his experiments in the 1840s the work necessary to rotate paddle wheels against the resistance of water in a tank generated heat that caused a slight rise in the temperature of the water. Joule found out exactly how much work was equivalent to a given quantity of heat. However one can do other things with work besides generate heat. In particular work causes motion, as when one pushes a car. Bodies in motion possess a special form of energy called kinetic energy which is equal to the work done in accelerating them from a state of rest. We have then, three closely connected ideas: work, heat and kinetic energy. Now according to the views of the nineteenth century which are still accepted, any heat given to a gas simply increases the kinetic energy of its molecules, the hotter the gas the faster its molecules are moving. If there fore the gas in our box is allowed to get hotter there is an increase in molecular speed, and the impacts on the walls become correspondingly more violent. But this means the pressure increases so we have another law: if the density remains the same the pressure increases if the temperature does.

Laws of Thermodynamics

Such consideration, as these have been pursued, with great elaboration and subtlety. The notions of heat, temperature, energy and work—familiar but vague in everyday life—have been given precise definitions and the relations between them have been enshrined in the Laws of Thermodynamics. Enshrined is perhaps a suitable word because these laws are so soundly and widely based on experimental results that they have greater prestige than any others in physics. If any proposed physical law comes in conflict with thermodynamics then so much the worse for that law—it has to be revised. It is sometimes asserted that no one is properly educated who does not understand the Second Law of thermodynamics. We cannot therefore leave this section without at least stating the two best known thermodynamic laws.

First Law. *If any physical system is given a quantity of heat and if the system performs some work then the energy of the system increases by an amount equal to the excess of heat given over work done.* This law asserts that heat, energy and work are convertible one into the other and that all such transactions balance exactly. This is one form of a principle accepted as fundamental in all science viz. the Principle of the Conservation of Energy according to which energy can never be created or destroyed but only changed from one form to another.

Second Law. *It is impossible to make an engine which will continuously take heat from a heat source and by itself turn it all into an equivalent amount of mechanical work.* In fact all engines which produce work from heat—steam engines for example—always use only a fraction of the heat they take in and give up the rest to some relatively cool part of the machine. The Second Law makes this obligatory on all work from heat devices. This statement of the Second Law has an engineering ring about it and indeed it arose from the work of the nineteenth century French engineer Carnot. Nevertheless, it can be re-phrased in very abstract terms, and has been applied with unbroken success to all fields of science involving the transfer of heat and allied matters. It sets a definite limit to the kinds of physical process that can be conceived to take place. Nothing has been known to contravene it.

The States of Matter

The molecular motion in gases has been referred to in the previous section. Tacitly it was assumed that each molecule acted independently of all others except that collisions occurred between them. In reality molecules exert attractive forces on one another and if a gas is cooled so that molecular movements become relatively sluggish, a time comes when the attractive forces succeed in

drawing the molecules close together to form a liquid. This process is called condensation.

The molecules in a liquid are packed tightly together and they impede each other's movements. On the other hand, movement still persists and the molecules struggle about like people in a milling crowd. Besides wandering about, the molecules vibrate. These motions represent the energy contained in the liquid.

The fact that the molecules, though irregularly packed, can still slip past one another and move from place to place explains the essential property of liquids that distinguishes them from solids—ability to flow. As a matter of fact, although the rather vague assertion that in a liquid molecules are irregularly packed would be generally accepted, there is no agreed opinion on what the irregularity is actually like. Indeed, not only the precise structure of liquids but the theory of liquids in general is fraught with such considerable mathematical difficulties that the liquid state is much less well understood than the solid or gaseous states.

Most solids are crystals. The popular idea of a crystal is of something which has a more or less regular geometrical form with faces that glint in the light—like snowflakes or gems. However, crystallinity really depends on a regular inner pattern of the atoms and may or may not show itself on the visible surface. A lump of lead, for example, is crystalline though it may not look it.

The actual arrangement of the atoms in a crystal can be extremely complex. Some are quite simple, however. The largest model of a crystal structure must surely be the 400 ft.

Atomium building in the 1958 Brussels Exhibition. This consisted of eight balls representing atoms situated at the corners of a cube and one more ball exactly in the middle. Imagine this repeated in all directions so that every ball is the centre of a cube whose corners are the eight neighbouring balls. This is known to crystallographers and physicists as the body-centred cubic structure. It is the actual arrangement of atoms in iron, sodium, chromium and some other metals. If every ball instead of being the centre of a cube were the centre of a regular tetrahedron (a solid figure with four equal triangular faces) and had its four neighbours at the corners of the tetrahedron, then we should have the diamond structure. This is how the carbon atoms are arranged in diamonds.

In crystals the atoms are locked into a regular ordered structure by attractive forces which give the solids its rigidity and prevent it from flowing. The atoms are so close together that any attempt to press them closer involves crushing or distorting the atoms—a process they resist strongly. This explains why solids (and liquids too) are so difficult to compress. Gases can easily be compressed because there is so much space between the molecules.

The distinction between solid and liquid is not so sharp as is commonly supposed. A lump of dough will not bounce, but it is plastic; a steel ball bearing is very elastic and bounces excellently, but one cannot mould it in the fingers. Neither dough nor steel qualifies for description as a liquid. There are, however, substances which can be moulded like plastics into a ball that will then bounce very well on the floor like an elastic solid and finally, if left on a flat table, will spread into a pool and drip off the edge like a liquid. There is no point in trying to force such things into rigid categories. One may say instead that for short sharp impacts the material behaves like an elastic solid but under long sustained forces it flows like a liquid. The properties of these and many other anomalous materials are increasingly engaging the attention of those who study the science of flow—*rheology*. It is interesting to see how many familiar and important materials exhibit peculiar rheological behaviour—paint, dough, ball pen ink, cheese, unset cement and solutions of nylon and other plastics are only a few examples.

Inside a Crystalline Solid.

We now return to our wallpaper analogy of crystal structure and give some free play to our visual imagination.

Suppose we have walls papered with a regular pattern of say roses, fuchsias and green leaves. These represent the different kinds of atoms in the solid. Careful observation shows that the whole pattern is shimmering. The flowers and leaves are not stationary but are undergoing slight random oscillations about their proper positions. In a crystal these movements are called thermal vibrations and are never absent. The hotter the crystal, the more the vibration and at a high enough temperature the vibrations become so great that the atoms get right out of position and the pattern disappears altogether, i.e. the crystal melts. Thermal vibrations are essential to the theory of solids and are responsible for numerous physical properties.

Next we note something extraordinary about some of the papered walls. On these the paper has been hung in irregular patches fitted together like a not very well made jigsaw puzzle. Lines of roses which should be vertical are horizontal in some patches, oblique in others. This represents the situation in most ordinary solids, for they consist of many small pieces of crystal irregularly packed together. Such material is called *polycrystalline* and the small pieces are *crystal grains*. Crystal grains may be almost any size, sometimes visible to the naked eye as often on galvanised iron.

However, on one wall we see excellent regularity and no obvious patches at all. The physicist would call this a *single crystal* and several techniques exist for preparing them. Natural single crystals can be found and there are some beautiful large single crystals of rock salt. But on examining the single crystal wall closely we find a number of places where the paperhanger has failed to make adjacent pieces register perfectly—there is a slight disjointedness. This occurs in real single crystals and the line along which the structure fails to register is called a *dislocation*. These are much studied by physicists because of their bearing on the mechanical properties of solids on the yielding of metals under strong stress, for instance.

This by no means exhausts the possibilities of the wallpaper analogy; several other phenomena can be found. For example, in a place where there should be a fuchsia there is actually a daffodil—something completely foreign to the pattern. Or perhaps a small wrongly shaped leaf is jammed between the proper leaves in a place that should really be blank. These represent chemical impurity atoms. The first is called *substitutional* because it occupies the position of an atom that should be there; the second is called *interstitial* because it does not. Substitutional impurities of indium metal, deliberately added to the semiconductor silicon, make possible the manufacture of transistors (see Section L). Some steels derive their valuable properties from interstitial carbon atoms within the iron pattern.

What physicists call a vacancy would occur if a flower or leaf were simply missing. Remembering that all the atoms are vibrating, we should not be surprised if occasionally an atom jumps into a neighbouring vacancy if there happens to be one, i.e. the atom and the vacancy change places. Later this may occur again. In the course of time a rose which was near the ceiling may make its way to the floor by jumping into vacant rose positions when they occur near enough. This process which the physicist calls *diffusion* is also analogous to the game in which numbers or letters can be moved about in a flat box because there is one vacant space to permit adjustment. The more vacancies there are in a crystal the faster diffusion occurs. It is in fact very slow in solids but is nevertheless evidence that apparently quiescent materials are really internally active.

Metals, Electricity and Heat

There is ample evidence that inside metals there are large numbers of free electrons. To illuminate this statement let us take sodium metal as an example. One single sodium atom has a nucleus with eleven protons; there are therefore eleven electrons in the atom. The outermost one is easily detached, leaving a positively charged sodium ion behind. We may think of these ions

arranged in the three dimensional pattern characteristic of sodium crystals. It is the same as the iron structure previously described. The detached electrons one per atom occupy the spaces in between. The usual metaphor is that the structure of ions is permeated by a gas of electrons. Like all visualisations of fundamental particles this must be taken as a rough approximation. The important point is that the electrons in the gas are not bound to individual atoms but may wander freely about the crystal hindered only by the collisions they make with the vibrating ions.

This is the picture as it appeared to physicists of the first decade of this century and we can explain many properties of metals with it. Naturally the theory has developed greatly since then thanks to the great work of Lorentz, Sommerfeld and Bloch. It now relies heavily on quantum theory but it is surprising how little violence is done to modern ideas by the simple picture we are using.

The free electrons move randomly in all directions at thousands of miles per hour. If the metal is connected across a battery it experiences an electric field. Electrons are negatively charged particles and are therefore attracted to the electrically positive end of the metal. They can move through the metal because they are free; thus flow is not possible to those electrons which remain bound to the ions. The function of the battery is to keep the flow going and for as long as it is going it is the electric current.

The flow of electrons is not unimpeded. They constantly collide with the ions and are deflected from the path of flow. This hindrance is what the electrician calls *electrical resistance*. The electric force due to the battery or a dynamo accelerates the electrons thus giving them extra energy but they lose this to the ions at collisions because the ions recoil and vibrate more than before. The net effect of innumerable collisions is to increase the thermal vibrations of the ions and to make the metal hotter. This is the explanation of the fact well known to every user of electric iron that electric current heats the conductor. If a strong current is passed through a wire the heating is so great the wire glows as in electric light bulbs or melts and breaks as in blown fuses.

If one end of a metal rod is heated we soon feel the heat at the other end. Metals are excellent thermal conductors. This is because the mobile free electrons carry the heat energy down the rod passing it on to the ions by colliding with them. Substances without free electrons cannot do this nor can they conduct electricity well so we have in the free electrons an explanation of the fact that the good electrical conductors are the good heat conductors. For technical purposes it would be useful to have electrical insulators that would conduct heat well and *vice versa* but this is almost a contradiction in terms and one can only compromise.

Non conductors and Semi-conductors

There are some elements and numerous compounds in which all the electrons are so tightly bound to their parent atoms that free electron flow is impossible. These materials are electrical and thermal insulators.

Let us return to our sodium atom. It readily loses its outer electron forming a positive ion. The ion is very stable indeed its electron arrangement resembles the closed shell belonging to the inert gas neon. The chlorine atom on the other hand would have a very stable structure resembling the inert gas argon if only it could be given one extra electron to complete the closed shell. If the outer sodium electron were given to a chlorine atom we should have two stable ions, one positive and one negative. These would then attract each other and form a compound. This is just how common salt, sodium chloride is formed and its crystals consist of a regular network of alternate sodium and chlorine ions. As all the electrons are bound to ions it is not surprising that salt will not conduct electricity or heat to any appreciable extent. Not all insulating compounds are built on this pattern, but all have structures which bind the electrons tightly.

We have seen (F18) that Nature does not permit a hard and fast distinction between solids and

liquids nor does she between conductors and insulators. Over a hundred years ago Faraday knew of substances which would conduct electricity but rather badly. A common one is the graphite in pencils. Others are the elements selenium, germanium and silicon and a considerable number of compounds. Such substances are called *semi conductors*.

Semi conductors conduct badly because they have so few free electrons, many thousands of times fewer than metals. In very cold germanium—say 200 degrees below freezing—all the electrons are tightly bound to atoms and the substance is an insulator. It differs from normal insulators in that on warming it the gradually increasing thermal vibration of the crystal detaches some of the electrons for they are only moderately tightly bound. The warmer the crystal becomes the more of its electrons become detached and the better it conducts electricity. By about the temperature of boiling water there are so many freed electrons that conduction is moderately good though less good than in metals. This is basic semi conductor behaviour. Because transistors can be made of germanium and because they are of such great technical importance more knowledge has accumulated about germanium than about any other material. See also Transistor Section L.

Magnetism

The most important thing about magnetism is that it is inseparably connected with electricity. Oersted showed this in July 1820 when he deflected a magnetic compass needle by passing an electric current through a wire near it. Since then many experiments have shown that wherever a current flows there will certainly be a magnetic field in the surrounding space. The laws of this are very well known now—they are the Maxwell equations previously referred to (F13). However most people first meet magnetism when as children they pick up iron with a magnet. Where is the electricity here? and what is a magnet?

The explanation of magnetism exemplifies beautifully the technique of explaining the bulk properties of matter in terms of fundamental particles. In the atoms the electrons are moving and a moving electric charge constitutes an electric current. Therefore each moving electron is a tiny source of magnetism. It does not immediately follow that every atom is a source of magnetism because it might—and often does—happen that the magnetic effect of different electrons in the atom cancel out. In helium atoms for example the two electrons have equal but opposed magnetic effects. Nevertheless some atoms and ions have a net effect called their *magnetic moment*. This simply means they behave like tiny magnets. Crystals containing such atoms will be magnetic though the magnetism is much weaker than in ordinary magnets because the different atoms largely annul one another's effects. In a very limited number of crystals however the magnetic ions act on one another in a special way which forces all the atomic magnets to point in the same direction. The total effect of many co-operating atoms is very strong and the crystal becomes what we normally call a magnet. Iron acts like this so do cobalt and nickel the rarer elements gadolinium and dysprosium and a fair number of alloys. On the whole this behaviour which is called *ferromagnetism* is very rare. The reason for the co-operation of all the atomic magnets is not explained to everyone's satisfaction yet though the key idea was given by Heisenberg in 1928.

In the section dealing with the electron it was pointed out that every electron has an *intrinsic magnetic moment*. This is in addition to any effect simply due to the electron's motion round a nucleus. The net effects of ions are therefore partly due to the intrinsic magnetism of electrons. In the ferromagnetic metals the latter is by far the most important contribution. Thus we pick up pins, and benefit from magnets in other ways, because innumerable fundamental particles act in co-operation for reasons that are still somewhat obscure. It is interesting to ask whether the electrons responsible for magnetism

are the same free electrons that allow the metals to conduct electricity. It is thought not

We are accustomed to think of magnets as metallic. Actually the magnet originally discovered by the Chinese was the mineral lodestone which is a non-metallic oxide of iron. Nowadays a number of non-metallic magnets are made. They are called *ferrites* and some are insulators and some are semi-conductors. The combination of magnetism and insulation is technically very valuable in radio, radar and other applications. The explanation of ferrite behaviour is related to that of metallic ferromagnetism, but is not the same.

Conclusion

The aim of the second part of this account of physics is to show how our conception of fundamental particles allows us to build theories of the properties of matter. This very aim shows that the two major divisions of physics referred to at the beginning (§9) are divided only in the way that labour is divided by co-operating workers to lighten the task. For the task of physics is a very great one—no less than to explain the behaviour of matter—and since the universe living and man-made is made of matter, physics must necessarily underlie all the other sciences.

III THE WORLD OF THE CHEMISTS

WHAT CHEMISTRY IS ABOUT

The science of chemistry is concerned with the properties of atoms, the laws governing their combination to form molecules and more generally with the behaviour of materials composed of large numbers of molecules. Thus chemistry borders on or rather interpenetrates physics—a fact illustrated by the existence of professional journals devoted to chemical physics and 'physical chemistry'. Physics is more concerned with the fundamental nature of matter and radiation; chemistry concentrates on the ways in which atoms combine or can be made to combine with each other to form innumerable compounds. Chemistry also merges with the life sciences where it deals as in biochemistry with the properties of the complex molecular building blocks of living organisms, e.g. proteins, carbohydrates, nucleic acids. Because of its comprehensiveness, the science of chemistry has been subdivided into what were at one time convenient sub-sciences, e.g. organic chemistry, electrochemistry, but here too the borderlines are becoming progressively blurred. Our task here will be to outline some of the ideas in use by present-day chemists.

ELEMENTS AND COMPOUNDS

Electron Shells and Stability

The reader will find in Part II a brief description of the atom and definitions of atomic number, atomic weight, isotope and other terms. The simplest atom is hydrogen (H) with atomic number 1. Some common elements with their chemical symbols and atomic numbers are—carbon (C) 6, oxygen (O) 8, sodium (Na) 11, chlorine (Cl) 17, calcium (Ca) 20, silver (Ag) 47, and uranium (U) 92. Let us now consider atoms in more detail.

The electrons in atoms move in well-defined orbits and the orbits fall into well-defined groups called *shells*. If all the orbits in a shell have electrons actually present in them, the shell is *filled* or *closed* and this confers on the shell an unusual stability or inertness. Conversely, unfilled shells lead to activity and the electrons in the incompletely filled shells largely determine the chemical and physical properties of the element and are responsible for the combination of atoms to form molecules. The inner shell, i.e. the one nearest the nucleus, can accommodate only two electrons (the element helium has just that number) and the next two shells can hold eight each. Large atoms, e.g. lead, radium, have many filled shells and subject to special exceptions the general rule is that the inner shells are filled ones and the outer shell may be incomplete. Elements which have equal numbers of electrons in their outer shell resemble each other. Thus the elements with complete electronic shells are chemically unreactive gases, e.g. argon and neon (minor constituents of the atmosphere). Elements with just one electron in the outer shell are highly reactive metals, e.g. sodium and potassium, whereas those with just one electron too few are also reactive but are not metals, e.g. chlorine, bromine, iodine.

Molecules, Ions and Bonds

The general tendency of matter is for those changes that are possible to go on happening until a lasting arrangement or *stable state* is reached. Atoms with closed shells are stable but atoms with unfilled shells can achieve stability in several ways of which two are as follows.

(i) Electron sharing

When atoms share electrons, the resulting structure composed of several atoms is known as a molecule. The simplest case is the molecule of hydrogen composed of two atoms, each contributing one electron. Thus each atom will have a share of two electrons which is the number required to fill completely the inner shell. The shared electrons constitute a *chemical bond* and confer stability on the resulting hydrogen molecule.

A more complex molecule is carbon tetrachloride, CCl_4 . Here the carbon atom with four electrons in its outer shell is bonded to four chlorine atoms each of which needs one electron to complete a set of eight. Thus by sharing the electrons each of the five atoms can form a complete shell of eight electrons. The properties of the resulting molecular species do not usually bear any resemblance to the constituent atoms. Whereas molecular chlorine is a gas and carbon is a solid, carbon tetrachloride is a liquid which finds application as a dry cleaning fluid.

(ii) Electron transfer

Another method of completing electron shells is by transfer of one or more electrons from an atom with one or two electrons in its outer shell to one with that number too few. Thus sodium with one electron in its outer shell will combine with chlorine, deficient in one electron. This results in two electronically stable species (ions) both of which carry electric charges. Thus the sodium will now have a net positive charge of 1 unit (11 protons, 10 electrons) whereas the chlorine has an excess negative charge (17 protons, 18 electrons). Because of these electric charges, solutions of ionic substances conduct electricity and this property is utilised in industrial processes such as electroplating and in the extraction of metals from their ores.

Thus the electrons which participate in the formation of chemical bonds are those in partly filled shells (valence electrons) and the simplest and most stable type of bonds are those in which two electrons are shared (a covalent bond) and those in which there is a net transfer of electrons (an ionic bond). Sometimes in order to attain a complete electronic shell, a chemical bond will require the sharing of four or even six electrons. The resulting molecules are highly reactive and will readily and sometimes violently combine with other molecules or atoms to achieve the greater stability associated with the two-electron covalent bond.

Molecules must not be envisaged as rigid assemblies of atoms with electrons uniformly distributed around the various nuclei. The properties of

molecules are best accounted for by imagining the atomic nuclei to be vibrating about mean positions the bonds acting like spiral springs, holding the nuclei together. The electrons form a mobile cloud of negative charge which surrounds the nuclei. The valence electrons constitute the bond between pairs of atoms although they have no fixed location but fluctuate about mean positions more or less along the line joining the atoms. Although the electrons are shared their mean position is not usually halfway between the two

and 46 g of alcohol both quantities will contain the same number of molecules. Similarly 1 litre of water with 342 g of sugar dissolved in it and 1 litre with 58.5 g of salt will again contain the same number of dissolved molecules because the molecular weight of sugar ($C_{12}H_{22}O_{11}$) and salt (NaCl) are 342 and 58.5 respectively. In each case the number of grams taken is numerically equal to the molecular weight and this amount is called 1 *mole* of a substance or the *gram molecular weight*.

Fig. 1 The arrangement in space of molecules CCl_4 , NH_3 , and H_2O

atoms but depends on the relative atomic sizes and charges. In the carbon-chlorine bond of carbon tetrachloride the valence electrons are subjected to electrical attractions due to 17 positive charges on the chlorine nucleus and 6 positive charges on the carbon nucleus. Although the forces due to the chlorine nucleus are partially compensated by the intervening, negative charges of the complete electronic shells, they are stronger than the forces from the carbon nucleus, and the valence electrons are thus attracted to the chlorine atom, which thus attains a net negative charge leaving the carbon with a corresponding, positive charge. The magnitude of this charge is less than that of an ion and the carbon-chlorine

bond should be symbolised $\overset{+}{C}-\overset{-}{Cl}$ to emphasise that separate positive and negative charges of equal magnitude are embodied in the structure and are attracting each other as well as causing an electric field outside the molecule

A pair of equal and opposite charges like this is called a *dipole* and is the electrical analogue of the ordinary *magnet* which has north and south *poles* instead of charges. Chemical bonds made with dipoles are called *polar bonds*. Most molecules, both simple and complex are bound with polar bonds but in the case of CCl_4 , the four bonds are symmetrically arranged in space so that the electric effects of the dipoles cancel each other outside the molecule which therefore does not as a whole act like a dipole. On the other hand the bond dipoles in a molecule may not cancel thus forming a *dipole* which, since the whole molecule will possess the properties of a dipole *eg* when subjected to an electric field it will rotate to align itself with the field just as a compass needle will line up with a magnetic field.

Atomic and Molecular Weights

The masses of the electron and proton were determined early in the 20th century by ingenious experiments. The electronic mass is extremely small about 9×10^{-31} kg and the mass of a hydrogen atom is 1.7×10^{-27} kg which indicates that the proton is 1837 times heavier than the electron and that the mass of the atom is almost completely confined to the nucleus.

The molecular weight of a compound is the sum of the atomic weights (F10) of all the constituent atoms e.g. water (H_2O) and ethyl alcohol ($\text{C}_2\text{H}_5\text{OH}$) have molecular weights 18 and 46 respectively. This means that the alcohol molecule weighs more than the water molecule in the ratio 46 to 18. If therefore we take 18 g of water

The word mole may also be used for atoms or ions and molar is in general that amount of a mole of any substance or atoms or ions that we use such that the total number of them is equal to the number of atoms in 12 g of carbon (F_{10}). This number called Avogadro's number is approximately 6×10^{23} . Thus one mole of any substance contains 6×10^{23} molecules of that substance and this fact makes the mole a very useful unit both in theory and practice.

Forces between Molecules

Something has already been said (F17 18) about the differences between solids liquids and gases and we may now put the question what forces are responsible for the organisation of molecules in liquids or solids and their disorganisation in the gaseous state? Questions of this kind are of profound interest to chemists physicists and biologists

FIG 2 Mutual polarisation of molecules by distortion of their electron clouds

The forces which act between molecules depend mainly on the fact that the electrons orbiting a molecule form a mobile cloud of negative charge. If a polar molecule is brought up to another molecule then the latter will become polarised, i.e. its electronic cloud will be displaced with respect to the nucleus. This is shown in Fig 2 and it is apparent that the formerly non polar

molecule has acquired a temporary polar character. In this state it will be able to polarise other nearby molecules and the ease with which molecules are polarised depends on how strongly the electrons are held in position by the nuclear charge and this in turn depends on the mean distance between the nucleus and the electronic cloud. Thus the larger the molecule the more easily the electron cloud can be distorted by a nearby dipole and hence the stronger are the intermolecular forces. These forces are attractions or *binding forces*. They can be disrupted by violent vibratory or other motions whose source is heat. As when a solid is first melted and then boiled and its molecules fly off in all directions to form a gas. Since strong attractions are due to ease of polarisation the latter must influence the melting and boiling points of substances.

As a general rule substances composed of small molecules have low boiling points and are gaseous at room temperature and atmospheric pressure because when they approach each other during a collision the forces they exert upon one another are not strong enough to produce cohesion and condensation. Examples of this type of behaviour are hydrogen and helium which boil at -253°C and -269°C respectively. Larger molecules are likely to be liquid at ordinary temperature and if the forces between them are even stronger they may be solid. Thus carbon tetrachloride which contains five atoms, boils at 77°C whereas glucose with 24 atoms ($\text{C}_6\text{H}_{12}\text{O}_6$) is a solid melting at 146°C . Chemical compounds which are ionic in character are usually crystalline solids with high melting points (e.g. common salt, quicklime) because ions possessing permanent charges exert stronger forces on one another than do molecules.

Metals and Salts

It has already been explained that chemical elements are conveniently classified according to the number of electrons in the outer shell because it is mainly those electrons which participate in chemical reactions and make bonds. Thus elements with 1, 2 or at most 3 electrons in the outer shell (e.g. sodium, calcium, aluminium respectively) will undergo reactions which enable them to lose those electrons and they will attempt to form ionic compounds. These elements are metallic and when solid or liquid conduct heat and electricity. On the other hand elements which need 1 or 2 electrons to form a complete shell (e.g. chlorine, oxygen respectively) can also form ionic compounds by reacting with a metal though these elements are themselves classed as non-metals and can be gases, liquids or solids at room temperature. When a metal atom combines with one or more atoms of non-metal the resulting ionic compound is termed a salt. Common salts of the metal sodium are the chloride, carbonate and sulphate. Other examples of industrially important salts are silver bromide (used in photographic films), calcium sulphate (plaster of Paris) and magnesium sulphate (Epsom salts).

Metals do not normally occur in the pure state in nature but are found as compounds (ores) sometimes of a complex structure. The science of metallurgy is concerned with the extraction of metals from their ores and with their properties and uses. Since many metals possess useful mechanical and electrical properties they find use as materials of construction and hence the knowledge of their properties and behaviour under different conditions is of great importance. One need only remember the imperfectly understood phenomenon of metal fatigue which led to the crashes of the early Comet aircraft to appreciate how vital is the contribution of metallurgy to the process of engineering.

Although metals can be mixed with other metals to form alloys the large majority of metallic compounds are the salts in which the metal is present as positive ion (*cation*) and the negative ion (*anion*) is composed of one or several non-metallic elements. Common anions are the chloride, bromide, iodide, nitrate, sulphate, phosphate, and carbonate. Metals with simple electron structures can form only one type of ion. Thus sodium with one outer shell electron forms Na^+ and 1 electron, calcium with two outershells

electrons forms Ca^{++} and 2 electrons. There are however a number of metals with more complex electronic structures involving partially filled inner electronic shells and these can exist in a variety of ionic forms. They include many metals which find application as structural materials e.g. iron, copper, gold, platinum, nickel, chromium. For instance iron can exist as Fe^{++} or Fe^{+++} and the process of removing a further electron from Fe^{++} is termed *oxidation* and any chemical reagent which is capable of bringing about such a process is an *oxidising agent*. Conversely the addition of an electron is called *reduction* and the reagent which can give up an electron is a *reducing agent*. Thus the conversion of Fe^{++} to Fe^{+++} is achieved by an oxidising agent which is itself reduced in the process. Processes involving the transfer of one or several electrons are called *redox* (reduction-oxidation) reactions and are of great importance in many branches of chemical technology and biochemical processes.

The non-metals which feature in the anions of salts include the well-known and industrially important elements sulphur, phosphorus, iodine, bromine and the common gases oxygen, nitrogen and chlorine. Table 1 (F23) provides a summary of the classification of a few of the more common elements according to the number of electrons in their outer shell. Although some of these elements e.g. aluminium undoubtedly possess metallic properties and others e.g. nitrogen as non-metals the dividing lines are not always so clearly defined and most of the compounds formed by elements near the centre of Table 1 are of the covalent type.

ACIDS AND BASES

pH Values

Hydrogen occupies a unique position in Table 1. According to its electronic structure it can be classified with sodium and potassium as having one electron in its outer shell. It therefore readily forms cations H^+ but it can hardly be called a metal. Having lost its electron what remains is a proton ($\text{F}10$) a single positive charge. Thus we can compare sodium chloride Na^+Cl^- with H^+Cl^- but whereas sodium chloride exists in the ionic form in the solid and liquid states and in solution HCl is a covalent gas in the pure state but readily ionises in solution because the H^+ does not exist on its own but attaches itself to a solvent molecule. Thus when HCl is dissolved in water it ionises and the H^+ combines with the water $\text{HCl} + \text{H}_2\text{O} \rightarrow (\text{H}^+\text{H}_2\text{O}) + \text{Cl}^-$. This is a typical example of what is known as an *acid-base reaction* an acid being defined as a substance which in solution can produce one or several protons (hydrogen ions) and the base as being a substance which can accept protons from an acid. In the above reaction HCl is the acid and H_2O the base and the reaction consists of the transfer of the proton from acid to base. Other common acids include sulphuric acid ($2\text{H}^+ + \text{SO}_4^{--}$) and nitric acid ($\text{H}^+ + \text{NO}_3^-$). When ammonia (NH_3) a covalent gas is dissolved in water an acid-base reaction also occurs $\text{NH}_3 + \text{H}_2\text{O} \rightarrow (\text{NH}_4^+\text{H}^+) + \text{OH}^-$. Here water acts as acid since it donates a proton to the ammonia forming NH_4^+ , the ammonium ion. When a proton is removed from water the remainder a negatively charged ion is called the hydroxyl ion OH^- . It has now been established that water can act either as an acid or a base and in pure water two molecules of water can react $\text{H}_2\text{O} + \text{H}_2\text{O} = (\text{H}^+\text{H}_2\text{O}) + \text{OH}^-$ so that one molecule behaves as an acid and the other as a base. This phenomenon is called self-ionisation and also occurs in other solvents.

The extent to which water ionises is very small thus 1 litre of pure water contains 10^{-7} moles each of H^+ and OH^- ions. However, the stronger an acid i.e. one that can produce more hydrogen ions than water is added the concentration of hydrogen ions increases and that of OH^- ions decreases correspondingly so that the product of the amounts of H^+ and OH^- ions will always be constant and equal to 10^{-14} (see law of chemical equilibrium). It is important to be able to compare the strengths of acid solutions and this is done by reference to the concentration of

hydrogen ions. The numerical measure is obtained by taking minus the logarithm of the hydrogen ion concentration and this number is called the *pH value* of the solution. Thus in pure water the hydrogen ion concentration is 10^{-7} moles per litre and the *pH* value is therefore 7.

Vinegar which is a dilute solution of acetic acid in water has a hydrogen ion concentration of about 10^{-4} moles per litre its *pH* is 4. Thus solutions with a *pH* value below 7 are acidic (they contain an excess of hydrogen ions) and those with a *pH* value greater than 7 are basic (they contain an excess of OH^- ions). Many chemical and most biological reactions are extremely sensitive to small changes in the *pH* and steps must frequently be taken to adjust the *pH* to an optimum value for a given reaction. This is achieved by means of substances known as buffers which have the capacity of mopping up or producing hydrogen ions and to maintain a constant *pH*. An example of this buffering action is the prevention of stomach acidity by the use of bicarbonates

between two oxygen atoms. The actual strength of such a bond is only about 10 per cent of that of an ordinary covalent bond and not very much energy is required to disrupt it. In terms of most chemical reactions the hydrogen bond is therefore not of great significance but it is vital in reactions which occur with small changes in energy i.e. biochemical reactions where the making and breaking of hydrogen bonds is frequently of supreme importance. It must also be

FIG 3 Formation of a hydrogen bond between neighbouring water molecules

THE HYDROGEN BOND AND WATER

Where hydrogen is covalently bonded to a small fairly strongly electronegative atom i.e. one which requires 1, 2 or 3 electrons to fill its outer shell, the one electron which can be supplied by hydrogen is not shared equally by the two atoms but is pulled closer to the electronegative atom. The most common examples of this phenomenon are liquid water and ice. Here the electronegative atom is oxygen as shown in Fig 3. The dots represent the outer shell electrons of oxygen and the crosses the electrons contributed by hydrogen. The oxygen atom 1 exerts a strong pull on the lone electron supplied by the hydrogen so that at the position of the oxygen atom 2 it appears as though the hydrogen is in fact an ion (H^+) devoid of electrons and since a pair of electrons of oxygen atom 2 are already pointing in the direction of this hydrogen atom a weak bond will be formed. Thus the hydrogen bond consists of one hydrogen atom

borne in mind that all biological reactions take place in an aqueous medium which is highly hydrogen bonded and it is well known that water is the essential substrate for all life processes although it is not always appreciated that water is also the most anomalous of chemical compounds. It is one of very few substances that are denser in the liquid than in the solid state (ice floats on water) and it is unique in that upon heating the liquid from its melting point to 4°C a further contraction takes place. From our discussion on intermolecular forces it is apparent that a chemical compound made up of small molecules being not very easily polarised should exist in the gas state at ordinary temperature and this is the case for other substances whose molecules have approximately the same dimensions as those of

TABLE 1

TABLE 2

Class of Compound	Elements	Example	Origin or Use
Hydrocarbon	C, H	Octane Benzene	Nat. oil deposit, fuel Coal tar solvent and raw material
Alcohols	C, H, O	Ethyl alcohol	Formed by fermentation of sugar
Amides	C, H, O, N	Acetamide	Constituents of synthetic polymers e.g. nylon
Lipids	C, H, O	Olive oil	Found in plant seeds used as food energy
Carbohydrates	C, H, O	Sugar starch cellulose	Occur in Nature—sources of energy and plant structural materials
Amino acids	C, H, N, O (S)	Glycine alanine	Building blocks of proteins
Steroids	C, H, O	Cholesterol	Hormone substances
Terpenes	C, H, O	Geraniol	Occur in Nature—perfumes

water, CO (carbon dioxide), NH_3 , and HCl . The unusual physical properties of water are due to the extensive hydrogen bonding which exists in its liquid and solid forms. Indeed ice is the most perfectly hydrogen bonded structure and liquid water appears to retain some of this regular crystalline order the main difference being that such crystalline regions are short lived forming and melting many millions of times every second. Nevertheless a snapshot of short enough exposure would no doubt reveal ice like regions in liquid water.

ORGANIC CHEMISTRY—THE CHEMISTRY OF CARBON COMPOUNDS

Of all the hundred odd elements which are now known and whose properties have been studied in detail carbon is unique in the manner in which it can combine with itself to give rise to very large molecules (polymers) which can have molecular weights of several millions. Carbon compounds form the basis of the substances which make up living organisms and thus the chemistry of carbon compounds is known as organic chemistry. Reference to Table 1 (F 3) shows that carbon is capable of forming 4 covalent bonds and the simplest organic compound is methane CH_4 (the main constituent of North Sea gas). The hydrogen atoms are capable of being replaced by other atoms or groups of atoms including carbon. Thus by replacing one of the $\text{C}-\text{H}$ bonds by a $\text{C}-\text{C}$ bond (CH_3CH_3 or C_2H_6) can be obtained. This process can continue and result in long chains of carbon atoms and the compounds so obtained form a series whose general formula is $\text{C}_n\text{H}_{2n+2}$ where n is any whole number. The compound C_8H_{18} is known as octane and forms the basis of petrol. The larger members of the series are the paraffin waxes. Starting again from methane and replacing one hydrogen atom by oxygen and hydrogen so that the carbon is covalently bonded to the oxygen, methyl alcohol CH_3OH is obtained. Once again this is the first member of a series the alcohols whose second member $\text{C}_2\text{H}_5\text{OH}$ (ethyl alcohol) forms the basis of all alcoholic drinks.

In addition to ordinary 2 electron covalent bonds carbon also forms bonds involving 4 and 6 shared electrons. These bonds are much less stable than the ordinary covalent bonds so that compounds possessing them are extremely reactive. Carbon atom chains can also form side branches or closed rings usually containing 3 or 6 carbon atoms. Furthermore the important group of aromatic compounds are based on benzene C_6H_6 in which the 6 carbon atoms form a planar ring and each has one hydrogen atom bonded to it. The remaining electrons form a mobile pool so that the whole molecule is easily polarised and can be made to react with many other substances. It follows that a large variety of compounds can be obtained using only the elements carbon, hydrogen and oxygen. If the elements nitrogen, phosphorus, sulphur are included as well as chlorine, bromine and iodine the number of possible compounds becomes even larger. Table 2 provides some examples of classes of organic compounds and their occurrence in nature or their industrial application.

To achieve the growth of molecules by the elongation of the carbon chains is not usually feasible technically although in nature this is a common process brought about by enzymes (F25(1)). However some molecules especially those with four or six electron bonds can react with one another to form polymers. In addition many molecules can be made to react (condense) to form more complex molecules with the elimination of a simple molecule such as water or ammonia. Examples of the latter type of polymer are the proteins which are composed of amino acid units (Table 2) the polysaccharides (carbohydrates) such as starch and cellulose made up of condensed sugar molecules (Table 2) and synthetic condensation polymers of acids and alcohols known as polyesters e.g. Terylene. Additional polymers also figure largely in chemical technology examples being polyvinyl chloride (PVC) polyolefines (e.g. polythene) and polystyrene.

CHEMICAL REACTIONS

Laws Governing Chemical Reactions

Large amounts of energy are locked up within molecules and some of this energy is used up in chemical reaction. Like other forms of energy (e.g. electrical and mechanical) it is subject to certain laws such as the law of conservation of energy which states that energy cannot be created or destroyed but can be converted from one form to another. Thus part of the chemical energy during the reaction may be converted into heat and this is frequently the case (F17).

Another very important law deals with the extent to which a chemical reaction will proceed. The reaction of nitrogen with hydrogen which combine to give ammonia forms the basis of the fixation of atmospheric nitrogen in the manufacture of fertilisers. The two gases combine in the molecular ratio of 1:3 two molecules of ammonia being produced i.e. $\text{N} + 3\text{H} = 2\text{NH}_3$. However ammonia also decomposes to form nitrogen and hydrogen and at a certain stage the rates of the two opposing reactions will be equal and the mixture is then said to be in equilibrium. The position of the equilibrium i.e. the amount of ammonia formed can be influenced by changes in temperature, pressure or the amounts of the reacting substances and the law of chemical equilibrium states that if any factor governing an equilibrium is altered then the equilibrium will shift in an attempt to counter the imposed alteration. Thus in the ammonia synthesis if ammonia is removed then more nitrogen and hydrogen will react in trying to re-establish the equilibrium. Furthermore the reaction between hydrogen and nitrogen proceeds with the evolution of heat so if the temperature of the gas mixture is raised (i.e. heat is added) then the equilibrium will readjust itself in an attempt to nullify the imposed change and accordingly some ammonia will decompose into hydrogen and nitrogen because this process absorbs heat.

The laws governing the influence of temperature, pressure and chemical composition on reactions are termed chemical thermodynamics and the effects described can be calculated in quantitative terms. Some of the problems of chemical engineering are concerned with maximising yields of chemical reactions while at the same time reconciling the necessary conditions with the economics of the process e.g. cost of plant materials and fuel.

One other important consideration is the speed with which chemical reactions proceed and the time taken to reach equilibrium (chemical kinetics). This cannot be predicted by the laws of chemical thermodynamics. According to thermodynamic calculations gaseous hydrogen and oxygen will react to form liquid water but this reaction is so slow that even in a million years not very much water would be formed.

Catalysts

Molecules react as a result of collisions during which the energy due to the collision must be channelled into the chemical bond which is to be broken or to be made. Although at ordinary pressure and temperature molecules collide many millions of times every second if all these collisions were to result in chemical reaction then all reactions would occur with explosive violence. In fact only a very small number of collisions are of a high enough energy for reaction to take place. This energy termed the energy of activation is therefore an important factor controlling the rate of a chemical reaction. The combination of hydrogen and oxygen normally has a large energy of activation and the two gases do not react to form water although thermodynamics predicts that the reaction is feasible. Reaction rates can be increased i.e. the activation energy lowered if certain solids are added on which one or several of the reacting species are adsorbed. The bond formed between the added solid (e.g. platinum) and the reacting gas is strong enough to weaken other bonds in the molecules so that on collision with another molecule reaction takes place more readily. The solid which itself does not participate in the chemical reaction is called a catalyst. Its function is to promote chemical

reactions between substances which because of the high activation energy could not react in its absence. Catalysts find applications not only in many industrial processes but are also extensively used by living organisms where they are called *enzymes*. Current theories hold that the reacting molecule fits into a hole or groove like a key into a lock, on the enzyme protein where it is held while the reaction takes place. An example of an enzyme catalysed reaction is the breakdown of starch by the body. This consists of several steps each of which is controlled by its own specific enzyme. These biological catalysts are much more efficient than those used in synthetic reactions both in their specificity and in the lowering of the energy of activation (i.e. the increase in the reaction rate). Sometimes a foreign molecule which bears a similarity to the molecule whose reaction is to be catalysed will combine with a catalyst. If this foreign molecule is very strongly held by the catalyst then the latter can no longer perform its function and is said to be poisoned. This is also true for enzymes e.g. carbon monoxide and cyanides act as poisons by combining with certain important enzymes and thus inhibit the biochemical reactions on which the functioning of organs depends.

SOME USEFUL APPLICATIONS OF CHEMISTRY

The application of basic chemical and physical principles to the manufacturing industries has led to the technological revolution which began at the turn of the century and is still gathering momentum. Although it is impossible to cover fully the areas in which the chemical sciences find application a few of the more important fields are noted below.

Electrochemistry

Electrochemistry deals with processes in which chemical energy is converted into electrical energy or vice versa. The most common examples are the dry battery and the lead storage battery (L13) although the generation of electricity by fuel cells (L43) is fast becoming of industrial importance. Conversely if a current is passed through an ionic solution a chemical reaction will take place and this principle is employed in the electrolytic refining of metal ores and in metal plating processes.

Surface Chemistry

Surface chemistry is based on the fact that solid and liquid surfaces have properties which are different from those of matter in the bulk state. A molecule A situated in the bulk interacts with its neighbours but the various forces will cancel as shown in Fig. 4. For a molecule B in the

Fig. 4—Surface Forces. Molecules within the solid (or liquid) are subject to balanced forces but for molecules in the surface there is a resultant downward force.

surface there is a net inward pull. The surface is therefore a high energy state and thermodynamics predicts that substances will try to minimise their total surface area. In a liquid this leads to the formation of spherical drops. The solid on the other hand will attract vapours and liquids which deposit surface films and thus reduce its surface energy. One application of adsorbed films catalysis has already been discussed.

Surface effects become significant in processes where the ratio of surface area to bulk volume is large, for instance where matter is finely dispersed. This is the case in the technology of paints, printing inks, detergency, dairy products, air and water pollution and solutions of polymers. The above mentioned properties are also utilised in processes which involve the deposition of substances on surfaces e.g. textile finishing (water and crease proofing), metal coating, herbicides, cosmetics and adhesives. Perhaps the most important field in which surface behaviour is one of the determining factors is biology. All one of the are separated from each other by membranes and nutrients and other chemicals are adsorbed on and diffuse through these membranes. The nature and action of which are as yet very imperfectly understood (F27(1)).

Photochemistry

Like other forms of energy, light, both visible and ultraviolet, can cause chemical changes to take place and conversely some reactions will give rise to the emission of radiation e.g. fluorescence. The ultimate source of most of the energy on earth is the radiation from the sun which by the process of photosynthesis (F28(1)) can be converted by green plants into the chemical energy stored in coal, oil and carbohydrates. The mechanism of photosynthesis is one of the most baffling problems in chemical kinetics.

In photography a film of gelatin in which are embedded small grains of silver bromide is exposed to light when a latent image is formed. This is believed to consist of submicroscopic specks of silver in some of the grains but the mechanism of its formation is still uncertain. The latent image can be developed into a negative image (silver) which is then fixed by dissolving away the unreduced silver bromide.

Analytical Chemistry

This is an important branch of Chemistry and deals with the identification and quantitative estimation of substances often in complex mixtures. Where a quantitative analysis is to be achieved the component under study has first to be separated in the pure state and then a suitable method must be found to determine its concentration in the mixture. In earlier days most analytical techniques were based on chemical reactions which were specific for the compound to be separated. Thus sodium chloride and sodium sulphate can be separated by making use of the fact that many metal sulphates are insoluble in water so that if a solution of say barium chloride is added to the mixture barium sulphate will precipitate as a solid and can be removed from the sodium chloride by filtration. If the amount of mixture initially used and the amount of precipitated barium sulphate are known then from the chemical formulae for barium and sodium sulphates, BaSO_4 and Na_2SO_4 , it is easy to calculate the percentage of sodium sulphate in the original mixture.

During the last 25 years chemical analytical techniques have gradually been superseded by much more refined physical methods. Most important among these are the spectroscopic methods which can distinguish between small differences in energies associated with the vibrational motions of different chemical bonds. Some of these techniques not only measure energy differences but can detect minute amounts of energy such as the energy liberated by a burning candle at a distance of 1 mile.

The detection, identification and sometimes the quantitative estimation of very minor constituents of mixtures is frequently of great importance in industrial processes and products. For instance the presence of 1 g of iron in a ton of edible oil will rapidly cause the oil to turn rancid. Another example of the importance of traces of chemical compounds is provided by flavour and aroma of foodstuffs and perfumes. Frequently the characteristic agreeable odour of a product is due to minute concentrations of one or several fairly simple organic compounds which at higher concentrations possess a quite unpleasant odour. The isolation of these compounds from natural

products such as fruit or flowers and their identification provides a continuous challenge to the ingenuity of the analytical chemist

Conclusion

It will now be readily seen that the science of chemistry covers a large field which extends from the very simple molecules such as H_2O to the complex naturally occurring molecules with molecular weights of several millions. It involves very fundamental studies ranging from the nature of the forces between atoms and the how and why of apparently simple chemical reactions to the very applied problems encountered in the manufacture of high strength construction materials. Among new fields which have developed rapidly during recent years petroleum chemicals rank high. This industry which is centered on the oil companies produces a large variety of substances such as detergents, polymer raw materials, solvents, dyestuffs, fats and waxes from by-products obtained during oil refining. Pharmaceutical chemistry too is rapidly developing and attempts

are being made not only to synthesise new drugs but to gain a better understanding of the mechanism of drug action.

Probably the most significant developments during the next twenty years will occur in the field of biochemistry. The elucidation of the structure and genetic functions of nucleic acids and some proteins has provided the impetus for further investigation into the chemistry and physics of these and other biologically active molecules. Other outstanding problems which may well be solved in the not too distant future include the mechanism of membrane action, muscle contraction and nerve impulse propagation in molecular terms. Where a hundred years ago the sciences of physics, chemistry and biology parted ways to follow their own separate paths they are now seen to be converging and the areas of overlap are gradually increasing as the molecular concepts of chemistry are providing a means of studying biological processes in terms of established physical laws and mechanisms. This part of the story will now be taken up in the section that follows.

IV BIOLOGY—THE SCIENCE OF LIFE

WHAT BIOLOGY IS ABOUT

Biology embraces the study of all living things which exist on earth at the present time and also the recognisable remains of those that are extinct. Living things or organisms range from the apparently simple micro-organisms such as viruses and bacteria to the largest animals and plants.

Living Processes

The enormous variation and complexity of living processes make the task of understanding and defining life a very difficult one. Every living organism undergoes continual physical and chemical changes which in spite of their diversity are referred to as the metabolism of the organism. Metabolism involves the processing of food materials, the production of waste products and all the intermediate stages between these whereby energy and matter are provided for the operation, maintenance and growth of the organism. These reactions are under very exact chemical or nervous control at every stage and can be slowed down or speeded up as the need arises. Thus the organism can react to changes in the environment in which it lives, adjusting its activities in relation to the external changes. Finally organisms can reproduce either in an identical or very slightly modified form. In this process new individuals are produced and the species continues to survive. Differences between offspring and parents can under certain circumstances act cumulatively over many generations and so form the basis of evolutionary change in which new species of organism are ultimately formed.

Molecular Biology

It has been evident for many years that the most fundamental aspects of these living processes occur in basic structural units known as cells. We shall examine this level of organisation first before we attempt to look at the larger questions of the organisation of multicellular animals and plants and their interactions in groups or populations. The study of living processes at the molecular and cell level has been given a tremendous impetus in recent years by the advent of new techniques which enable microscopic and submicroscopic parts of cells to be examined. Physicists, chemists and mathematicians have found themselves working alongside biologists in this field and several of the very notable advances have been made by physical scientists. At this level of organisation the traditional division of Biology into Botany, the study of plants and Zoology, the study of animals has little meaning. Even the more recent Genetics, the study of inheritance, Biophysics and Bio-

chemistry concerned with the physics and chemistry of organisms and Cytology, the study of cell structure are losing such identity as they may once have had. Molecular biology is a term frequently used in describing this rapidly expanding and fascinating field of research.

THE CELL

Cells were first seen in 1665 by Robert Hooke when he looked at a piece of cork under his primitive microscope. It was not until 1839, however, that Schleiden and Schwann produced the cell doctrine which visualised the cell as both the structural and functional unit of living organisation. Exceptions may be found to the cell doctrine. For example, some protozoa, algae and fungi show very complex internal organisation but are not divided into cells; they are usually called acellular organisms. The viruses also constitute a difficulty since in many ways they are intermediate between living and dead matter. They are absolutely dependent on cells of other organisms for their continued existence. Outside living cells they are inert molecules which may take a crystalline form. Inside a host cell however they become disease-producing parasites which multiply and show many of the other properties of living organisms. They are minute and lack the complex organisation usually associated with cells. Notwithstanding their somewhat ambiguous position, the viruses are often treated as though they were single cells or parts of cells and their extreme simplicity has made them ideal material for many types of research at this level. The bacteria also lack some of the properties of cells but the differences are not so clearly defined as they are in the case of viruses.

Structure and Function of Cells

Though the constituent cells of a multicellular organism are usually specialised to perform particular functions they have a great many features in common. The cell is often said to be made up of a substance called protoplasm, a term for the fundamental material of life which dates from the 19th century. Protoplasm has two main constituents, the cytoplasm and the nucleus and is bounded on the outside by a cell or plasma membrane. Plant cells generally have an additional wall composed primarily of cellulose and used for support. The nucleus is the controlling centre of the cell and has rather limited metabolic capabilities. The cytoplasm contains various subunits which operate to produce energy and new cell structure during the normal metabolism of the cell.

Cells take up the raw materials for metabolism

through the cell membrane from extracellular fluid which surrounds them. The nutrients include carbohydrates, fats, proteins, minerals, vitamins and water. Fats and carbohydrates are important principally as sources of energy though both types of compound are found in permanent cell structure. Proteins are complex substances of high molecular weight which contain nitrogen in addition to the carbon, hydrogen and oxygen found in the other compounds. They are of fundamental importance in the structure and function of the cell and are built up of a number of simple nitrogen containing organic molecules called amino acids. There are twenty amino acids occurring commonly in nature so that the number of possible combinations in large protein molecules is quite clearly enormous. A group of proteins whose significance is well established are the enzymes which are the catalysts of chemical reactions in living cells. Each enzyme will control and speed up a specific reaction even though it is present in very small amounts and is usually unchanged at the end of the process. A large number of inorganic mineral salts are essential for cells to function normally. Some such as sodium, potassium and calcium salts are needed in considerable quantity, others are required only in trace amounts and these include iron, copper and manganese. The trace elements are usually important constituents of enzyme systems. Vitamins are also necessary in very small amounts and it seems reasonable to conclude that their function is also a catalytic one in parts of some enzyme systems.

I CYTOPLASM.

For a long time cytoplasm was thought to be a homogenous and structureless substrate in which enzymes occurred as part of a general colloidal system. With the refinement of techniques such as electron microscopy and ultracentrifugation, more and more identifiable components have been found within the cytoplasm. It now seems certain that the material other than these recognisable particles is not a structureless matrix but a highly organised and variable complex at the molecular level.

Identification of Components recent techniques *Ultracentrifuge*

When soft tissues such as liver are ground up in a homogeniser which usually takes the form of a plunger fitting fairly tightly into a glass tube the cells are broken up but the smaller particles escape destruction. The particles remain in a highly active biochemical state if the salt concentration of the liquid into which they are released by homogenisation is more or less the same as that within the cell from which they came. Early failures to isolate cell fractions were almost all attributable to osmotic difficulties in which differences of salt concentration led to the movement of water into or out of the particles and to their subsequent destruction. The homogenate can be treated in a centrifuge in which high speed rotation subjects the particles to forces many thousands times greater than gravity. As a result the heaviest particles such as the nuclei are deposited first on the bottom of the centrifuge tube. The liquid is then transferred to another tube and the process repeated at a higher speed which brings down slightly lighter particles called mitochondria. The next collection of particles which can be obtained is called the microsomal fraction. By careful use of this technique biochemists can produce a variety of cell constituents which can be studied in the absence of all the other reacting systems of the cell.

Radioactive Isotopes

In many of the studies of cell chemistry which have been made on whole cells, on cell fractions or on isolated enzyme systems progress has been due in a large part to the availability of isotopes. With the aid of compounds prepared in the laboratory and labelled with the radioactive isotopes of elements such as carbon, hydrogen, nitrogen, oxygen, sulphur and phosphorus, biochemists can now follow the metabolic fate of

these substances in living organisms. The presence of a radioactive labelled element in any of the products of metabolism can be determined by means of Geiger and scintillation counters. The studies involving radioactive isotopes have shown more clearly than any others that living material is never static but is in a state of dynamic equilibrium. Substances are constantly broken down and replaced by other substances so that an organism may appear to be more or less unchanging but its components are always turning over.

Light Microscopy

Many of the particles which can be isolated and studied have been identified within the living cell by means of the light microscope. Especially useful in this respect have been the phase contrast and interference modifications which make structures of different refractive index visible and do not depend on differences in light absorption as does the ordinary instrument.

Electron Microscope

In light microscopy true images of particles smaller than the wavelength of light cannot be formed. Great difficulty is experienced in resolving particles much smaller than 0.5 microns (0.0005 millimetre) in size. The electron microscope which uses a beam of electrons instead of light is capable of much greater resolution because electrons behave as rays of extremely short wavelengths. Details as fine as 20 Angstroms (0.002 microns) have been resolved and a tremendous amount of structure has been revealed by this instrument. However many of the objects which are well known from electron microscope studies have not been isolated nor have functions been ascribed to them. Conversely much of the biochemistry of cells cannot be linked to known structures. One of the great limitations of the electron microscope is that it can only be used to examine very thin slices of dead material.

X ray Diffraction

A method which can reveal a great deal of information about the arrangement of constituent parts in very complex biological molecules is that of X ray diffraction. In this method X rays are reflected from regularities in the molecular structure so as to form a pattern characteristic of the structure. Studies of X-ray diffraction patterns can be made on living material so that the internal shape of biological molecules can be worked out and the changes if any followed during phases of activity. In many ways X-ray diffraction has been useful in filling the gaps between biochemical studies of molecular behaviour and the essentially static view of cell structure obtained from the electron microscope.

Constituents of Cytoplasm.

The following are some of the particulate and membranous constituents of cytoplasm which have been identified and analysed with varying degrees of success by these and many other techniques.

1. Mitochondria and Oxidation.

Mitochondria vary in shape from cylindrical rods to spheres and in size from 0.2 to 3.0 microns. When seen in the living cell they are in constant motion. The whole structure is enclosed within a thin double membrane the inner layer of which is thrown into folds extending across the central cavity of the mitochondrion and dividing it into small chambers. The function of mitochondria is to provide energy for the reactions of the rest of the cell. Almost the whole machinery for the oxidation of foodstuffs is to be found in the mitochondria and as might be expected is related in some way to the complex structure. Slight damage to the mitochondrion will render it unable to carry out a complete cycle of oxidative processes. Destruction of parts of the double membrane system prevents the production of energy-rich phosphate bonds in adenosine triphosphate (ATP) in which energy is stored and transported about the cell.

The Krebs Cycle

The oxidative reactions which produce the energy are quite unlike those in which hydrocarbons are burnt in the laboratory. They proceed through a large number of controlled steps during which the energy is slowly evolved. The basic fuel substances carbohydrates, fats and proteins are broken down outside the mitochondria to four major intermediate products which are pyruvic acid, oxaloacetic acid, acetic acid and ketoglutaric acid. These acids diffuse into the mitochondria and are oxidised in a cyclical system of reactions called the Krebs or citric acid cycle which ultimately leads to the production of carbon dioxide and water. The actual oxidation of the various compounds participating in the cycle is brought about by a series of enzymes described as an electron transport chain. Oxidation in these cases is essentially a removal of electrons from the substrate invariably accompanied by an equal number of hydrogen nuclei. The electrons sometimes with and sometimes without the hydrogen nuclei are passed from one compound to another until eventually they combine with oxygen to form water. One of the best known electron transport systems is that involving iron containing substances called cytochromes.

An example of a typical stage in the Krebs cycle is the conversion of succinic acid to fumaric acid under the control of the enzyme succinate dehydrogenase. Both acids are compounds containing four carbon atoms but the latter has two electrons and two hydrogen nuclei fewer than the former which is therefore said to be oxidised during the conversion. The electrons are accepted by the first member of a chain of cytochromes which is thus reduced and the hydrogen is set free as hydrogen ions. The electrons are passed down the chain of cytochromes which are reduced in turn and re-oxidise the earlier members of the chain. In the final stage the reduced cytochrome is oxidised by oxygen which accepts the electrons and combines with the hydrogen ions to form water. These steps produce energy but this does not all appear as heat because some is used to drive a reaction which consumes energy. The first law of thermodynamics states that such a coupling is necessary if a high energy compound is to be produced. The energy consuming reaction is the conversion of adenosine diphosphate (ADP) to adenosine triphosphate (ATP) with its energy rich phosphate bond. The whole process is known as oxidative phosphorylation. The mitochondria produce far more energy than they require and the ATP passes into the cytoplasm for use in the rest of the cell.

2 Chloroplasts and Photosynthesis

Chloroplasts are particles found in cells in the green parts of plants in fact they contain the green pigment which is called chlorophyll. They are involved in the extremely important process known as photosynthesis in which energy absorbed from light is used to synthesise carbohydrates from carbon dioxide and water oxygen being formed as a by product.

Chloroplasts are disc shaped or flat ellipsoids from 2 to 20 microns across possessing a complex structure which in many ways is reminiscent of that found in mitochondria. A typical double membrane surrounds the structure and the inside is made up very largely of a stack of discs consisting of paired membranes connected at their ends to form closed systems. This seems to be a further development of the type of lamellated structure seen dividing the central cavity of a mitochondrion. The chlorophylls and other pigments such as the orange yellow carotenoids seem to be arranged in layers a single molecule thick in the chloroplast discs so that they are maximally exposed to light.

Photosynthesis

In photosynthesis there are two somewhat independent sets of reactions one needing light and the other going on in the dark. The primary process is the absorption of light quanta by the chlorophyll which causes some of the electrons of its molecule to pass from one orbital to another

and thus enter an excited state. It is thought that chlorophyll then loses electrons which pass either to a recently discovered protein called ferredoxin or to another oxidising agent plastocyanine. The electrons from plastocyanine are transferred via a complex series of steps involving a cytochrome chain back to the chlorophyll. During these sequences oxygen is liberated from water molecules and energy rich phosphate bonds are produced. The production of ATP in this reaction which can only take place in the light is called photosynthetic phosphorylation and in this respect makes plants independent of stored carbohydrate as their primary energy source.

The reactions so far described have not involved carbon dioxide and though it is possible to make the system operate solely in this way it is not usual for it to do so. Normally the electrons from ferredoxin are passed to another electron accepting system together with hydrogen ions from water. At the same time as recent isotope studies have revealed carbon dioxide is combined with a 5 carbon sugar and the resulting compound immediately splits into two molecules of a 3 carbon phosphoglyceric acid. The reduced electron system which has oxidised ferredoxin now comes into operation and together with energy from ATP is used to synthesise sugar and starch from the 3 carbon compounds. The reactions in which carbon dioxide is taken up or fixed and then reduced during the formation of sugar can go on in the dark unlike those of photosynthetic phosphorylation described earlier.

The importance of this process whereby plants can make use of the energy in sunlight to fix carbon dioxide and produce carbohydrates is quite clear. The whole animal population of the world including man is dependent on plants for food since even the meat eating carnivore, prey upon herbivores. Although scientists continue to make efforts to produce adequate food materials from simple compounds there is still no better machinery known for doing this than the plant cell. Man is dependent on photosynthesis not only for his supplies of food but also for much of

FIG 1 *Nucleic Acids* A portion of a DNA molecule showing how it is made up of two strands of nucleotides. Each nucleotide consists of a base which may be Adenine (A), Thymine (T), Guanine (G) or Cytosine (C) united to the Pentose Sugar Deoxyribose (S) in turn joined to Phosphoric Acid (P). The nucleotides are linked through the phosphoric acid groups. The two strands are held together by hydrogen bonds between bases, adenine linking only with thymine, and guanine only with cytosine.

his fuel since much of the combustible material removed from the earth is of plant origin. In this respect atomic energy may eventually prove to be an adequate alternative

3 Endoplasmic reticulum Ribosomes and Protein Synthesis

A network of elaborate and oriented double membranes existing within parts of the cytoplasm can be seen in the electron microscope. In the space between the pairs of double membranes small granules are visible either free in the space or attached to a membrane. The whole system is called the endoplasmic reticulum or ergastoplasm. When the cell is homogenised and centrifuged the endoplasmic reticulum appears as the microsomal fraction. Biochemical analysis after separation of the membranous from the granular components reveals that the former is composed largely of phospholipids and cholesterol which are compounds closely related to fats and the latter of ribonucleic acid (RNA).

Nucleic Acids

The term nucleic acid covers a class of substances usually of great complexity built up from smaller units called nucleotides. Each nucleotide consists of a base united to a sugar in turn united to phosphoric acid. Nucleotides are joined together in a linear fashion by means of the phosphoric acid residues to form a chain from which the bases project at right angles (Fig. 1). Two types of sugar are found in naturally occurring nucleic acids and these are the ribose of RNA

and the deoxyribose of deoxyribonucleic acids (DNA). We shall return to the latter when the nucleus is considered. Four nitrogen-containing bases occur in nucleic acids and in RNA—adenine, cytosine, guanine and uracil. In DNA the uracil is replaced by thymine.

Protein Synthesis

There is good evidence that RNA is manufactured exclusively within the nucleus and subsequently moves out into the cytoplasm. Some of it called ribosomal RNA, unites with protein to form the granules or ribosomes of the endoplasmic reticulum. Another form called messenger RNA, also migrates from the nucleus to associate with ribosomes but does not become incorporated into their permanent structure. It is also well established that the ribosomes are closely linked with protein synthesis in the cell because radioactive amino acids when fed to an animal are always found first in the ribosomes before any other cell structure. The specification for a particular protein is not carried on the ribosome which is merely the factory for making these complex molecules. It is thought that messenger RNA carries instructions from the nucleus which specify exactly the protein to be synthesised at a ribosome. This is done by means of a code in which a triplet of three nucleotide bases codes one amino acid (Fig. 2). Thus on a long molecule of RNA three adjacent uracil bases would specify an amino acid called phenylalanine. If these were followed on the RNA molecule by one uracil and two guanines then the amino acid tryptophan would be specified and this would be

Fig. 2 A portion of a molecule of messenger RNA, associated with a ribosome and synthesising a protein. The base sequence on the messenger RNA has been determined by the helix labelled with the downward pointing arrow in Fig. 3. Adenine specifies Uracil (U), Cytosine specifies Guanine (G), Thymine specifies Adenine (A), and Guanine specifies Cytosine (C). The ribosome is moving down the messenger RNA strand, reading the triplet code. Amino acid 4, which is phenylalanine specified by UUU, has just been joined to three other amino acids and its carrier RNA released to the cytoplasm. Amino acid 5, tryptophan specified by UGG, is attached to its carrier RNA and is in position ready to be joined to the protein chain by the ribosome. Amino acid 6, methionine specified by UAG, is attached to its carrier RNA but has not been brought into position on the messenger RNA strand. Other amino acids and carrier RNA molecules exist free in the cytoplasm and have not yet associated.

joined to the phenylalanine. In this way complex protein molecules can be built up according to instructions emanating from the nucleus for each of the 20 different amino acids. It is far from clear how the amino acids in the cytoplasm are brought into position on the RNA template and how they are activated so as to combine and form protein. It is thought that they are first attached by appropriate enzymes to small molecules of so called carrier RNA in the cytoplasm before associating on the template of messenger RNA. The association is then accomplished by a ribosome which moves along the messenger RNA chain as it were reading the code and taking appropriate carrier RNA amino acid complexes from the surrounding medium. There are still many gaps in our knowledge of the exact sequence of events.

This system is responsible for building and maintaining much of the organisation of the cytoplasm. All the enzymes for example catalysing every reaction within the cell will be specified and built up on the appropriate RNA template. The understanding of protein synthesis is of fundamental importance to the whole of biology and has particular significance in studies on cancer where cell growth becomes abnormal.

4 The Golgi Apparatus

The characteristic features of the Golgi apparatus are numbers of large vacuoles or spaces bordered by closely packed layers of double membranes. The latter look very much like the membranes of the endoplasmic reticulum but do not have the ribosome particles along their edge. They are therefore known as smooth membranes in contrast to the rough membranes of endoplasmic reticulum. The function of the Golgi apparatus is not established though it may be associated with secretory activity of the cell.

The Golgi apparatus has been the subject of controversy for many years and illustrates one of the major difficulties in working at the molecular cell level. The Golgi structure can only be seen through the light and electron microscopes after the cell has been through a number of preparative stages. Many biologists thought that the preparation itself was responsible for creating the Golgi apparatus and that nothing like the objects seen would really exist in the living cell. Though there is now little doubt that the Golgi apparatus is a real constituent of the cytoplasm the general problem of creating artefacts by the involved treatment in many investigations remains a very real one.

5 Cell Membrane

Though the cell membrane plays a most vital part in regulating what can enter and leave the cell it remains rather poorly understood. It is thought to consist of a double layer of lipid molecules with a layer of protein probably outside the lipid. Fairly large molecules seem to be able to penetrate the membrane in relation to their fat solubility which would support the hypothesis of its lipid framework. Small molecules and ions appear to penetrate in relation to their size the smaller ones getting through more readily than the larger. This suggests that pores of a certain size exist in the membrane.

The cell membrane has mechanisms which can move ions and other substances against concentration differences either into or out of the cell. A fine microelectrode can be pushed into a cell and the electrical potential of the inside determined with respect to the outside. In all the cells studied so far there is a potential difference across the membrane which is produced by the non uniform distribution on either side of ions particularly those of sodium, potassium and chloride. Though these potentials have been studied in animal and plant cells generally, they are best known from the work on nerve cells where sudden changes in the membrane potential are the basis of nerve impulses. A great deal is now known about the mechanism whereby the potential change and thus the nerve impulse is propagated from one end of a nerve to the other. The basic process which produces the nerve impulse in any

region of the nerve fibre has been shown to be a sudden increase in permeability of the membrane to sodium ions in that region. A problem of much interest is how such activity can be passed from one nerve to the next that is to say how a change of potential in one cell membrane can be made to affect an adjacent cell membrane. Such a process is fundamental to the large collections of nerve cells which form the nervous systems of animals. Transmission takes place at a special region called a synapse and when an impulse reaches this region it causes the release of a small amount of chemical transmitter substance which diffuses to the membrane of the adjacent cell. There it combines with the membrane in such a way as to change its permeability to ions and so produce a nerve impulse in the second cell. A number of transmitter substances have now been identified and many of them are related chemically to tranquillisers and other drugs affecting the nervous system.

II NUCLEUS

The main regions of the nucleus are the surrounding nuclear membrane a mass of material known as chromatin and a small sphere called the nucleolus. The nuclear membrane is a double structure very much like the membranes of the cell surface and endoplasmic reticulum. Suggestions have been made that these membranes are continuous at some regions within the cell. The status of chromatin was in doubt for many years. Light microscope studies reveal very little structure in the nucleus until the time when the cell is preparing for and undergoing division or mitosis. At this time a number of discrete double strands the chromosomes are revealed by virtue of their chromatin content—the material stains heavily with basic dyes.

Cell Division

During division the chromosomes behave in regular and recognisable sequence. In the first stage called prophase they appear and at the same time the nuclear membrane breaks down. Next in metaphase the chromosomes become arranged across the equator of a spindle shaped collection of fibrils which appears in the area formerly outlined by the nucleus. Then follows anaphase in which the two threads of each chromosome the chromatids move to opposite poles of the spindle. Finally in the last stage telophase nuclear membranes are formed round the two separate collections of chromosome material and the cytoplasm itself divides into two. Thus two cells are formed each containing the same number of chromosomes as the parent and the cells enter a period of rest or interphase between divisions. During interphase the chromatin material disappears and the possibility was considered of the chromosomes being assembled as a prelude to every cell division and then being dispersed in the nuclear sap afterwards.

This suggestion is in direct conflict with the view that chromosomes are the carriers of genes.

Genes

These are the elements which contain all hereditary information and the medium whereby hereditary features are transmitted from one cell to the next either in the same organism or from parents to offspring via the fertilised egg. Experiments indicated that the same genes always occupy the same position on chromosomes and this really demands a structural continuity through the life of the cell. The chromosomes undoubtedly persist but it is still not certain why or how they change so as to become visible during division. One suggestion has been that the nucleic acids of which they are very largely made up condense during the period of prophase. In the resting nucleus the chromosomes may be much more swollen and occupy much of the nucleus.

The problem that has attracted the most attention and is possibly the most fundamental that biology has to offer is that of the nature of the

genes. The important material of the genes is known to be deoxyribonucleic acid (DNA) made up of nucleotides as is PNA though in this case the bases are adenine, cytosine, guanine and thymine. The DNA molecule is large and complex. Two long chains of nucleotides are known to coil round in a double helix with the pairs of bases on each helix directed towards one another and linked by means of hydrogen bonds (Fig. 3).

Fig. 3 The actual arrangement of the two nucleotide strands in a double helix, with the bases projecting and linking the two helices as shown.

Furthermore if adenine is the base on one chain thymine must be its partner on the other and similarly guanine can link only with cytosine. Because of this pairing off of bases there is sufficient information in a single chain of nucleotides to resynthesise the double helix once more. Thus if we examine a section of a single strand of the helix and find bases in the order adenine, thymine, guanine, adenine, cytosine, we can predict that in similar positions on the other strand we shall find thymine, adenine, cytosine, thymine, guanine. The capacity of one half of a DNA molecule to specify the other half exactly enables the system to be self replicating in a way that is essential in a hereditary transmitter and fits in well with what is known of chromosome behaviour during cell division.

Transmission of Genetic Information

Accepting that DNA is the material of the gene it remains now to examine the nature of the information which it passes from cell to cell and organism to organism. Long before the structure and significance of the DNA molecule was known, geneticists were finding that alterations in a gene known as a mutation usually affected a particular chemical reaction and this in turn caused the changes seen in the organism as a whole. The

effect was due to the failure to synthesise a necessary enzyme and so the hypothesis 'one gene = one enzyme' gathered currency. This view has now been extended to include proteins other than enzymes and it is now certain that specific genes control the synthesis of specific proteins. The DNA of the genes transmits the instructions about protein synthesis to the ribosomes via messenger PNA. In the nucleus messenger RNA is made with specific base sequences in its molecule by using DNA as the template. Thus a group of three adjacent 'adenine' bases in DNA would produce a group of three 'uracil' bases in the synthesised RNA and this would lead to the specification of phenylalanine at the ribosome as we have seen. Only one of the two strands in the DNA double helix participates in the production of PNA.

Within the nucleus the nucleolus is believed to play an important part in the synthesis of PNA since its turnover of this material is very rapid. It has been suggested that the nucleolus supplies the PNA produced by chromosomes and acts as the channel through which this material is relayed to the cytoplasm. There is now some good evidence which points to the nucleolus as the source of ribosomal PNA since cells which lose the nucleolus have no ribosomes.

The processes involved in nuclear control and the transmission of information from cell to cell is summarised in the aphorism 'DNA makes PNA and PNA makes protein'. The system of carrying that information in the base sequences of DNA molecules has become known as the genetic code. A remarkable landmark in the study of DNA occurred when towards the end of 1967 Kornberg and his colleagues managed to synthesise a virus DNA in a test tube. The synthesised molecules proved to be capable of infecting bacteria in the same way that the naturally occurring virus would. The DNA was synthesised using an extracted virus DNA molecule as template and attaching nucleotides by means of appropriate enzymes. The newly made molecules were then separated from the template. It can hardly be claimed that this is the creation of life in a test tube since the template was extracted from a living virus. The experiment suggests many possibilities in experimental modification of the genetic constitution of an organism with all the far reaching ethical consequences.

MULTICELLULAR ORGANISATION

It is axiomatic if evolutionary theory is accepted that in the course of very long periods of time there has been a general change in multicellular organisation from the simple aggregation of cells with little individual differentiation to the highly specialised and differentiated cells and tissues seen in complex animals and plants. It is fascinating to speculate on the environmental variations and internal mechanisms which together produced this result. The problem is so vast however that a complete analysis is impossible and even a statement of the sequence of changes is in many cases highly controversial.

Another aspect of becoming multicellular where the problems offer more hope of analysis is that the complex organisation must be built up in the lifetime of each animal or plant from the single celled stage of the fertilised egg. We have already seen how cells can divide repeatedly handing on self replicating chromosomes so that each cell is apparently identical. If this were really so then division of the fertilised egg would result in an unorganised mass of cells showing no differentiation. The essential problems in development are: (1) how is the smooth succession of shape changes produced during cell division so that an appropriate and recognisable end product is reached? (2) how do the cells differentiate during this temporal sequence so that those which form part of the eye are different from those of liver and blood?

Method of Development

There are some important differences in the method of development in animals and plants. In animals there tends to be a relatively short period

during which the basic structure is produced and after which growth, repair and replacement may cause adjustment rather than major change. In higher plants on the other hand the apical regions of both roots and shoots remain in permanently embryonic state and add material, which then differentiates in a continuous process throughout the life of the plant. In spite of these differences—and in any case there are many exceptions—the two main problems in development are essentially similar in both animals and plants.

A great deal of work has been done on animal development since this takes place in a fairly stereotyped way during a short period of time. The fertilised egg of an animal divides in such a way as to form a hollow ball of cells, the blastula, which folds in on itself to produce a two layered sac, the gastrula. A third layer, the mesoderm is now added between the two layers known as ectoderm on the outside and endoderm on the inside. At this stage much of the animal's basic structure is established. Many aspects of this orderly sequence can be explained in terms of specific adhesive properties of cells so that a cell will stick to others of the same type but not to unrelated types. Other mechanical properties such as elasticity particularly in surface layers are important in maintaining shape and producing appropriate changes during processes when one layer is folded in on another. Why cells should have the different physical properties necessary to produce an integrated whole embryo is not known but certainly it cannot be thought that every cell has an absolutely fixed constitution and therefore a predetermined role in development. Large parts of developing embryos can be removed in early stages and their places taken by remaining cells so that intact organisms are still produced. One is led to conclude that the surroundings of a cell have a great deal of influence on the way it reacts and that there is a great deal of adaptability in the developing system especially in its early stages.

Formation of Specialised Tissues

These points lead us on to the second major question concerning the differences which appear progressively in cells during development so that specialised tissues are ultimately formed. This is essentially a problem in the regulation of gene activity since we know that each cell division produces daughter cells which are genetically identical. It seems likely therefore that instructions are carried on the chromosomes to cope with all requirements of the organism, but that in specialised cells only a small fraction of this full potential is realised. For a long time embryologists have known that egg cytoplasm shows regional differences which make identical nuclei behave differently and it is thought that regional cytoplasm can in some way control gene activity. Techniques for the transplantation of nuclei in developing frog embryos have been perfected and it has been possible to put a nucleus from an intestinal cell of a tadpole into an enucleate egg. The egg will go on to develop normally even though its nucleus came from a fully specialised cell derived from endoderm. The embryo will form blood and muscle from the mesodermal layer and all the other components of an organism under the influence of a nucleus which normally would have produced none of these things. One can conclude that all the genes are present even in the nuclei of specialised cells but that they have to be placed in a suitable cytoplasmic environment in order to be activated. Similar nuclear transplantation experiments indicate that genes can be turned off as well as turned on by an appropriate cytoplasmic environment even though the nuclei come from cells which are so specialised as to stop dividing. The components of cytoplasm which control gene activity are still quite unknown.

A study of cell differentiation and the development of multicellular organisation leads us to the view that important though the nucleus and its genes are in controlling cell activity an integrated organism is the result of complex interactions between its constituent cells and between the cytoplasm of those cells and their nuclei.

THE CLASSIFICATION OF ORGANISMS

It was clear to the biologists of the 17th cent. that animals and plants could be fitted into different groups or species. John Ray a leading biologist of the day defined a species as a group of individuals capable of interbreeding within the group. This criterion with its corollary that a species is reproductively isolated from organisms outside the group has survived more or less unchanged to the present day. The early workers also saw that some species were very similar to one another while others were obviously dissimilar. Systems of classification based on the similarities and differences were drawn up so that all organisms could be fitted into a orderly scheme and species could be given names in accordance with the scheme. The most famous collector and classifier was the Swede Linnaeus who established his reputation in the 1730s. A very large number of animals and plants are known by the names given to them by Linnaeus.

Systematics as the study of species and of higher groups of classification is called acquired a new significance after Darwin and the Theory of Evolution. From the biological point of view the most satisfactory classification became one which reflected the evolution of the organisms classified. Such a system based on the phylogeny or evolutionary history of a group is called a natural classification. It is not always easy to produce because ancestral types tend to become extinct and the problem then becomes one of reconstructing a whole branching system when only the ends of the branches are known. A great deal of the work on systematics has of necessity to be done on museum specimens which may be fossils or material preserved in some way by the collectors. The biological criterion of reproductive isolation cannot be used to define a species when the only available representatives are in a preserved state. In this case the scientist must resort to an assessment of structural differences in an attempt to decide whether two organisms are of different or the same species. It has often been said unfairly that such species are subjective concepts which exist only in the mind of the systematist. In recent years comparative techniques have been used to compare large numbers of structural differences between groups of animals or plants. Physiological and biochemical characteristics are also becoming part of the armoury of the 20th cent. systematist. All these techniques have led to the realisation that even the species cannot be regarded as a static point in an evolutionary pattern. Some species die out and others arise as conditions in the environment slowly change. This essentially dynamic view of a continually shifting equilibrium between animals, plants and their environment has given rise to what Huxley has aptly called *The New Systematics* in his book of that title.

When the systematist shifts his attention to the higher levels of classification the problems are just as great as at the species level. Different species having features in common can be grouped together into genera, genera into families, families into orders, orders into classes and classes into phyla. The dividing lines between different groups at all levels is always difficult and in the final analysis somewhat arbitrary since at these levels we do not have any biological criterion such as exists for the species. The evolutionary status of the larger groups is also poorly defined. Many are now recognised to be polyphyletic which is to say that there are several main evolutionary lines running right through the group.

THE ANIMAL KINGDOM.

The animal kingdom is divided into about 24 large groups or phyla though the number varies between different classifications. Ten of the more important phyla are listed below.

1. Protozoa.—Microscopic unicellular forms of great variety. Some may have more than one nucleus and others form colonies. Many are able to swim by waving hair like flagella or cilia.

Others move by putting out extensions of the body or pseudopodia into which the rest of the body then flows. Protozoa are found in the sea, in fresh water and in the soil. Some are parasitic and cause important diseases in animals and man such as sleeping sickness and malaria.

2 Porifera—Sponges. Very primitive multicellular animals whose cells display considerable independence of one another. Largely marine. The body which may become branched and plant-like is supported by a framework of spicules and fibres. The bath sponge is the fibrous skeleton of certain species.

3 Coelenterates—Hydra, jellyfish, sea anemones, corals. Simple animals which have a body only two cells thick surrounding a gut cavity with a single opening to the outside. Largely marine. Many are colonial. Coral reefs are formed from the calcareous skeletons of these animals.

4 Platyhelminths—Flatworms which are free living in water and liver flukes and tapeworms which are parasitic. A third solid block of cells, the mesoderm, has been developed between the two layers of cells seen in the coelenterates. A simple gut may be developed and the reproductive system is complex especially in the parasitic forms.

5 Nematodes—Roundworms. The body is smooth and pointed at each end. Some of the most numerous and widespread of all animals. Free living in all environments and parasitic in practically all groups of plants and animals. At the same level of complexity as the Platyhelminths.

6 Annelids—Segmented worms such as earth worms, marine worms and leeches. A system of spaces, the body cavity, is developed in the mesoderm so that movements of the main body of the animal and movements of the gut become more or less independent. Digestive, excretory, circulatory, nervous and reproductive systems are all well developed.

7 Arthropods—A very large, diverse and important group of animals which includes crustaceans such as crabs, shrimps and water fleas; myriapods such as centipedes and millepedes; insects and arachnids such as spiders and scorpions. The arthropods show many of the developments seen in annelids and in addition they possess a jointed hard exoskeleton. Paired appendages grow out from the segments of the body and form antennae, mouth parts, walking legs, etc. The muscles within the skeleton are able to exert a fine control over the movement of the appendage. In order to grow these animals have to shed the exoskeleton periodically.

8 Molluscs—Mussels, clams, oysters, squids, octopods and snails. Complex body form but somewhat different from annelid-arthropod type. Unsegmented body protected by shell which is variously developed in different types. It forms two valves in mussels and oysters, a spiral structure in snails, is reduced and internal in squids and completely lost in octopods.

9 Echinoderms—Starfish, brittle stars, sea cucumbers, sea urchins and sea lilies. All marine and all radially symmetrical, usually with five radii. Completely unlike the other advanced, major groups. Circulatory, excretory and nervous systems differently developed. Locomotion and feeding by means of hundreds of tube feet projecting from under surface.

10 Chordates—Sea squirts, Amphioxus, fish, amphibians, reptiles, birds and mammals. Segmented animals which at some stage in their life have gill slits leading from pharynx to the outside and a supporting notochord from which, in all chordates except sea squirts and Amphioxus, is developed a vertebral column or backbone. Those animals with a backbone are commonly referred to as vertebrates, all those without as invertebrates. These are obviously names of convenience having no phylogenetic significance since they lump together totally unrelated phyla in one case and align these with a part of a single

phylum in the other. The vertebrates have been investigated more completely than any other animals because of their direct structural and functional relationship with man himself. There are five well defined classes which are listed below. The first vertebrates were the fish and from them came the amphibians. The amphibians gave rise to the reptiles and both birds and mammals evolved from different reptilian stock.

(a) Fish

Cold blooded aquatic animals breathing by means of gills. Sharks, rays and dogfish belong to a group known as the elasmobranchs characterised by a skeleton made of cartilage. Bony fish or teleosts include almost all the fresh water fish and the common marine fish such as cod, mackerel, plaice, herring, etc.

(b) Amphibia

Cold blooded, more or less terrestrial animals which have to return to water to breed. Five fingered limbs are developed in place of the fins of fish. The egg hatches into a tadpole larva which is aquatic and breathes by gills. At metamorphosis the larva changes into the terrestrial adult which possesses lungs. Some amphibians such as the axolotl may become sexually mature as a larva and so never metamorphose into the adult. The class includes newts, salamanders, frogs and toads.

(c) Reptiles

Cold blooded and terrestrial. These animals do not return to water to breed because they have an egg with a relatively impermeable shell containing the food and water requirements of the developing embryo. There is no larval stage. Present day reptiles such as lizards, snakes and crocodiles are all that remains of a tremendous radiation of dinosaur-like creatures which occurred in the Mesozoic (F44).

(d) Birds

Warm blooded and adapted for aerial life. The characteristic feathers act both to insulate the body against heat loss and to provide the airfoil surfaces necessary for flight. The birds are an astonishingly uniform group and show less diversity of structure than much lower classification categories (e.g. the teleosts) in other classes. The relationships of the 19 000 or more species of bird are difficult to establish because of this uniformity. It is clear that the flightless forms such as the ostrich are primitive and that the penguins are also in a separate category but the typical modern birds are classified in a large number of rather arbitrary orders. About half of all the known species are placed in one enormous order called the Passeriformes or perching birds.

(e) Mammals

Warm blooded animals which have been successful in a tremendous variety of habitats. Mammals are insulated from the environment by the characteristically hairy and waterproofed skin. They are with two exceptions viviparous which means that their young are born alive and in typical mammals at an advanced stage of development. In the marsupials of Australia the young are born at an early stage and transferred to a pouch where they develop further. The two exceptions referred to are primitive monotreme mammals known as the duck billed platypus and spiny ant eater and these animals lay eggs. The young of mammals are suckled by means of the milk producing mammary glands. The mammals include aquatic whales and dolphins, hoofed ungulates, flesh eating carnivores, rodents and insectivores, the aerial bats, and the tree climbing primates to which man himself belongs.

THE PHYSIOLOGY OF ANIMALS

Some basic features of cell organisation have already been dealt with, and in unicellular animals all life processes, such as respiration, movement

growth and reproduction proceed in the single cell. However, in multicellular animals cells are of various types constituting distinct tissues and organs which perform special functions in the body. Although each cell has its own complex metabolism there must be co-ordination between cells forming special tissues and between the tissues which form the whole organism in order for the body to function efficiently. The study of these functional interrelationships at the tissue and organism level of organisation is the province of the physiologist.

1 Movement Fibrils and Skeletons

(a) **Muscles**—The prime movers in almost all animal movement are large protein molecules in the form of microscopic fibrillar threads. In some way not yet fully understood these fibrils can convert the chemical energy stored in the high energy phosphate bonds of ATP into mechanical energy. In the long thin cells forming the muscles of animals it has been discovered that there are two sets of fibrils one formed of a protein called myosin the other of actin arranged in a regular interdigitating fashion. When the muscle contracts the fibrils slide into one another so that although the fibrils themselves do not change in length the muscle as a whole develops tension and shortens. Thus the Sliding Filament Theory of Muscle Contraction was formulated in 1953 by A. F. Huxley, H. E. Huxley and J. Hanson. Fine bridges extend from the myosin fibrils to attach on to the actin and it is here that the conversion of chemical to mechanical energy goes on.

(b) **Skeletons**—In order for muscles to work effectively it is necessary for them to operate in some sort of skeletal system. Contraction but not relaxation is an active process; muscles must be arranged in antagonistic pairs so that one muscle can extend the other. A skeleton also provides a system of levers so that the muscles can do work against the environment in an efficient manner. A simple type of skeleton found in fairly primitive animals is the hydrostatic system of coelenterates and worms. Here the animal can be thought of as a fluid filled bag or tube which can change shape but whose volume remains constant. By contraction of circular muscles the tube will become long and thin and conversely contraction of longitudinal muscles makes the tube short and fat. Examination of an earthworm will demonstrate how alternating waves of activity of this type passing from head to tail can move the animal over the ground. The earthworm shows an advance over the simplest systems because the hydrostatic tube is broken up into small units by the segmentation of the body. This makes local responses possible. The next advance to be seen is the development in animals such as arthropods and vertebrates of a firm skeleton to which muscles are directly attached. The skeleton can then be used to support the body and to engage the environment. It seems to matter little whether an endoskeleton (vertebrates) or exoskeleton (arthropods) is developed since in both cases a tremendous radiation of fins for swimming, legs for walking and wings for flying can be seen. However in other respects these two types of skeleton show significant differences. The exoskeleton for example offers more protection than the endoskeleton while apparently setting an upper size limit. All the really big animals have endoskeletons.

(c) **Cilia**—Fibrillar systems are also seen in the fine hair like cilia which project from the surface of some cells. Cilia are important in a number of ways. They are the organelles of movement in many Protozoa; they are used to produce water currents past the bodies of some aquatic animals and they are of great importance in moving fluid within the body of almost all animals. They beat in a regular fashion, the effective stroke being accomplished with the cilium held straight out from the surface and the recovery stroke with the cilium flexed at the base.

Cilia possess the same structure no matter

where they come from. In transverse section eleven fibrils can be seen which run the whole length of the organelle. Two of the fibrils are single and situated centrally while the other nine are double fibrils arranged in a circle around the periphery of the cilium. Work is still going on in this field but it has been suggested that the peripheral fibrils are contractile and cause the cilium to bend. The function of the central fibrils is unknown.

2 Nutrition and the Alimentary Canal

All animals must take in and digest food materials. As well as water they require complex organic substances: proteins, fats and carbohydrates together with small amounts of salts and vitamins. These materials are obtained by eating the dead bodies of plants and other animals. They are taken into the alimentary canal and there broken down or digested by enzymes into simpler soluble amino acids, sugars and fatty acids. These substances are absorbed and distributed to various parts of the body where they are used in cell metabolism (F26-27) or stored for future use.

(a) The Size of Food—Microphagy and Macrophagy

Many animals called macrophagous feeders take in relatively large masses of food. Some such as frogs and snakes swallow their food whole but many break it up first. Arthropods have modified appendages arranged round the mouth for cutting; some molluscs have a rasp like radula with which to scrape off particles and many mammals break up their food with jaws and teeth. The teeth are usually well adapted to the type of food. Carnivores have large sharp canines, premolars and molars with which to tear the flesh of the prey; fish eating seals have small peg like teeth to grip the fish and herbivorous ungulates have flat grinding teeth with which they break up hard plant material.

In contrast microphagous feeders collect small particles of food material from the environment by continuous filtration. In bivalve molluscs and many marine worms water currents are produced by beating cilia. Food is trapped within the confined space through which the water flows by means of a plentiful supply of sticky mucus in the filtering region. Some crustacea use fine hairs to sieve off food material, often from water currents created by the swimming movements. The most startling of filter feeders is the whalebone whale. As the whale swims forward a stream of water flows in at the front of the mouth and out at the sides via sheets of whalebone which filter off the organisms on which the animal feeds. Though macrophagy seems to favour the attainment of larger size there are exceptions! Another type of particulate feeding is seen in those animals which eat deposits of detritus as do many worms. Finally some animals take in only soluble food materials. These fluid feeders include internal parasites like the tapeworm which absorb substances over the surface of the body and insects such as the aphid with sucking mouth parts.

(b) Reception and Storage

The food now passes into the alimentary canal which may be fairly simple straight tube but more usually becomes long and coiled. The gut tube may be divided into several functional components though the divisions must not be regarded as absolute. The first section is usually involved in the selection by taste, smell and texture and the reception of food. A lubricating mucus together with some digestive enzymes may be added at this stage from glands such as salivary glands. A large crop for food storage occurs in animals as diverse as insects and birds but in mammals this region remains as a simple tube called the oesophagus.

(c) Mixing, Grinding and Early Digestion

Waves of contraction in the muscles of the gut move the food onwards. This peristaltic action delivers the food to a region known variously in

different animals as the stomach gizzard or gastric mill. Here the further disintegration and mixing with enzymes is accomplished in many forms simply by contraction of the muscle of the stomach wall. Stones may assist the action in the gizzard of birds for example and more bizarre modifications are seen in some crustaceans and molluscs. In the former there is a complicated gastric mill with grinding surfaces, teeth and a filter and in the latter a long rod called the crystalline style is rotated by ciliary action against a hard pad on the opposite wall of the stomach. In the ruminating mammals such as sheep and cattle the stomach is divided into four chambers. The function of the first two of these is to mix food with a bacterial culture which exists in this region and to regurgitate the cud for further grinding. The bacteria break down plant cell walls and so benefit the host which cannot deal unaided with the main component known as cellulose. The final two chambers of the ruminant stomach are more typical in function.

A variety of digestive enzymes are released into the stomach region. Carbohydrates, fats and proteins are all broken down to some extent. The main enzyme in the stomach of vertebrate animals is a proteinase which works under acid conditions.

(d) Final Digestion and Absorption

The finely divided food now passes on to the intestine where digestion continues using enzymes liberated in the preceding region or under the action of new enzymes released from intestinal glands. In the vertebrates the pancreas secretes a number of enzymes acting on all types of food material, one of the most important being the protein breaking trypsin. The pancreatic secretion is liberated into the anterior end of the intestine known as the duodenum and operates in an alkaline medium.

Soluble products of the process of digestion are absorbed through the wall of the intestine into the blood stream. Blood vessels carry the food material to the liver where it is put to use in the animal's metabolism or stored as liver glycogen. The surface for absorption is increased by tremendous folding of the intestine interior seen as finger like villi in higher vertebrates or as the so called spiral valve in some fish.

(e) Processing of Waste Material.

The undigested remains of the food now pass through the most posterior regions of the alimentary canal known simply as the hindgut in many forms or as the colon and rectum in others. A major function of this region particularly in terrestrial animals is the removal of water so as to conserve this vital material. In the rectum the faeces are formed and stored before being eliminated from the body.

3 Respiration Gills, Lungs and Tracheae

The oxidations which consume oxygen and produce carbon dioxide go on at the cellular level as explained earlier (F20). All living cells respire and remain alive only if supplied with oxygen. In a multicellular body however many cells are remote from the oxygen of the environment and the need arises for an efficient respiratory system by which oxygen can be taken up and carbon dioxide released. In addition a circulatory system is necessary to transport the oxygen to and from the respiring cells.

(a) Simple Gas Exchange Systems.

Animals such as protozoa which because of their size have a high surface area to volume ratio do not need special structures for gas exchange. Diffusion over the whole body surface ensures an adequate supply of oxygen. Much larger animals such as earthworms also find it possible to rely on diffusion alone partly because their consumption of oxygen is fairly low and partly because their bodies are permeable all over. For various reasons most animals restrict the permeability of the outer layers of the body and under these conditions special respiratory areas have to be developed.

(b) Gas Exchange in Water

Aquatic animals except those such as whales breathing at the surface have to obtain their oxygen from the supplies which are dissolved in the water. This presents several problems because water is a dense medium there is not a lot of oxygen in solution and its diffusion rate is low. For these reasons there is a surprising functional uniformity in gill systems and they are very different from lungs. Gills are fine finger like processes with a good blood supply which are held out in a water stream. The water current is brought very close to the gill filaments so that the length of diffusion pathway for oxygen is minimal. There is a counter current flow of water and blood so that the water containing most oxygen comes into contact with the blood just leaving the gill. This ensures that most of the oxygen can be transferred from water to blood through the thin gill cells. The efficiency of counter current systems is well known to the engineer but they were invented by aquatic animals long before they were by man. These features can be seen in the gills of molluscs, crustacea and fish. The pumping devices which maintain the water currents also operate economically. Flow is maintained in crustacea by appendages modified to form beating paddles. In many molluscs by ciliary movement and in fish by the operation of a double pump in mouth and opercular cavities. In almost all cases there is a continuous current over the gills, the water coming in one way and going out another. Thus the animal avoids reversing the flow with the consequent waste of energy in accelerating and decelerating a large mass of water. Fish for example take water in at the mouth and force it out through the gill slits (sharks) or operculum (teleosts).

(c) Gas Exchange in Air

Air breathing animals do not encounter these problems since the medium is less dense, contains a great deal (20%) of oxygen and diffusion rates are high. Lungs are therefore in the form of sacs whose walls are well supplied with blood. The area of the walls may be increased by folding so that the lung becomes spongy and full of minute air spaces called alveoli where the gas exchanges goes on. Only the main airways receive fresh air as the lung expands, oxygen is renewed in the alveoli by diffusion. Ventilation of the lung is accomplished by a tidal flow of air in and out of the same tubular opening known as the trachea. The actual ventilating mechanism varies in different animals. In the amphibians for example air is forced into the lungs when the floor of the mouth is raised with the mouth and nostrils shut. The lungs are emptied by elastic recoil and by lowering the floor of the mouth. Higher vertebrates use a costal pump which changes the volume of chest and lungs by movements of the ribs. This change in volume is further assisted in mammals by the diaphragm, a sheet of muscle which lies beneath the lungs and separates thorax and abdomen. In many animals sound producing organs are associated with the lungs and tracheae. The larynx is a vocal organ in frogs, some lizards and most notably mammals. In birds voice production takes place in the syrinx situated further down at the base of the trachea.

A completely different gas exchanging system is seen in insects. Branching tubes known as tracheae run throughout the body and carry oxygen directly to the cells without the intervention of a blood system. The tracheae communicate with the outside world via a series of holes called spiracles. Although the main tubes may be actively ventilated, diffusion in the system accounts for a large part of the movement of oxygen between the outside world and cells.

4. Circulation

In simple, small animals there is no blood system and dissolved oxygen, nutrients and other materials move about the body solely by diffusion assisted to a certain extent by streaming movements of protoplasm within the cells. In larger animals a transport system is necessary to convey materials about the body and in many but not all, it is in the form of a blood system. Blood systems are of two types closed and open.

(a) Open Systems

In an open circulatory system blood is pumped from the heart into a few major arteries but these very quickly give way to large tissue spaces or sinuses so that the tissues and organs of the body are directly bathed in blood. Blood flows slowly from the sinuses back to the heart. Both molluscs and arthropods possess an open system. The heart in most arthropods is a long thin tube in the dorsal part of the body pumping blood towards the head. Auxiliary muscles may be attached to the heart to pull it out and refill it after the pumping cycle. Mollusc hearts on the other hand are of the chambered type with thin walled auricles receiving blood from the gills and pumping it to a more muscular ventricle. The ventricle in turn contracts to pump blood to the body. In squids and octopods two auxiliary hearts are seen receiving blood at low pressure from the body and pumping it through the gills and thence to the main heart.

(b) Closed Systems

In a closed system blood is pumped round the body in a branching network of arteries and comes into contact with tissues and cells via very thin walled vessels called capillaries. Substances diffuse into and out of the blood through capillary walls. From capillaries blood enters the veins and so returns to the heart. Blood flow in the tubes of a closed system is much more brisk and blood pressures tend to be higher than in an open system. In annelids the closed system is fairly simple with a vessel above the gut in which blood moves forward connecting to one below in which blood moves backwards. The blood is pumped by peristaltic contraction of the vessels and this system must be regarded as the precursor of a localised pump. Simple hearts are in fact seen in some annelids.

In vertebrates a well defined heart is always present situated ventrally at the level of the fore limbs. In fish there is a single auricle and ventricle and the latter pumps blood directly to the gills. From the gills the blood is collected into a dorsal aorta which then branches to serve the rest of the body. Associated with the development of lungs and loss of gills in the tetrapods we see a progressive modification of this simple pattern. The most posterior gill vessel is taken over as the lung or pulmonary artery and slowly a completely separate circuit evolves. This involves the division of the single heart into right and left sides the former pumping blood to the lungs and the latter to the body. In the birds and mammals where the division is complete the system can be seen to be functionally satisfactory. Blood flows along the following route: left auricle to left ventricle to body to right auricle to right ventricle to lungs to left auricle and so on. Thus blood charged with oxygen in the lungs returns to the heart before being pumped to the body. In the lower tetrapods division of the heart is incomplete and considerable interest centres on the function of these apparently imperfect systems. Amphibian hearts have two auricles but only a single ventricle. In spite of this evidence is accumulating to show that blood from the lungs and body is not mixed as it passes through the ventricle. A further complication in amphibians is due to the moist skin also being used for gas exchange. Some oxygen is thus contained in blood returning from the body. Reptiles show a further advance in that the ventricle is almost completely divided into two. The system appears still to be functionally inadequate because one of the major arteries to the body leaves from the deoxygenated side along with lung vessels.

(c) Function of the Blood

Most of the materials transported by the blood such as nutrients, waste materials and hormones are carried in solution in the plasma. The respiratory gases oxygen and carbon dioxide, are present in greater quantity than would be possible if they were in simple solution. Carbon dioxide is carried in the form of bicarbonate and oxygen combines with blood pigment. The best known blood pigment is haemoglobin which is found in a variety of animals and gives the red colour to blood. When oxygen is present in high concen-

tration as it is in the lungs combination occurs to give oxyhaemoglobin. If the concentration of oxygen is low as it is in the tissues dissociation occurs and oxygen is given off leaving reduced haemoglobin. Carbon monoxide will combine more readily than oxygen with haemoglobin so that in carbon monoxide poisoning the blood can not transport oxygen. The haemoglobin of vertebrates is contained in high concentration in red blood corpuscles. The amount of haemoglobin and hence oxygen carried is greater than if the pigment is not in corpuscles. In mammals the oxygen carrying capacity of blood is thirty times that of a similar quantity of water. Other blood pigments are the blue haemocyanin found in crustacea and molluscs and the violet haemerythrin found in some worms. Also present in the blood are various types of white corpuscle which are part of the defence mechanism of the body and ingest invading bacteria. Special blood proteins such as fibrinogen causing clot formation and antibodies effective against foreign substances occur in the plasma.

5 Excretion Ionic Regulation and Kidney Tubules

As the chemical reactions included under the term metabolism proceed so numerous waste products accumulate. The most important of these are compounds containing nitrogen such as ammonia, urea and uric acid arising from the use of protein as an energy source. In terrestrial animals they are removed from the blood by the kidney. The basic unit of a kidney is the tubule. In worms these tubules are not concentrated into a solid kidney but occur a pair in every segment right down the body. The kidney tubule begins with an end sac, corpuscle or funnel which is closely associated with the body cavity or the blood system. Fluid is filtered from the body cavity or blood into the corpuscle whence it passes to the tubule proper. During passage down the tubule useful materials are reabsorbed through the tubule cells into the blood whereas unwanted materials remain and pass to the outside world.

Although it is usual to think of kidney function being primarily one of nitrogenous excretion it is quite common to find that in aquatic animals the kidneys are hardly used for this purpose. In these animals the tubules are primarily concerned in regulating the salt and water levels in the body nitrogenous wastes being eliminated by diffusion through any permeable surface. In fresh water for example all animals have osmotic problems since the body fluids have a much greater osmotic pressure than the environment. Water tends to enter the body and salts tend to leave. Fresh water animals produce large quantities of very dilute urine filtering off a lot of blood plasma into the tubules but reabsorbing all wanted materials including the invaluable salts. Fresh water crustacea, molluscs and fish all possess tubules of different morphology which show very similar functional properties.

Different environmental conditions impose different demands on the osmotic and ionic regulating machinery. In very dry conditions such as in deserts it is obviously of advantage to reabsorb as much water from the tubule as possible. All animals do this but it is interesting that only birds and mammals have discovered the secret of so concentrating the urine that its salt concentration is higher than that in the blood. This is done by means of a hairpin like loop in the tubule called the Loop of Henle. Another example of a counter current device.

6 Co ordinating Systems

Overall co ordination of the animal's body so that it functions as a whole and reacts appropriately to environmental changes is largely the province of two systems one chemical or hormonal the other nervous. In one respect these are systems for homeostasis that is for preserving the *status quo* in spite of considerable environmental fluctuation. Paradoxically they can also initiate change as, for example one can see in the daily repertoire of complicated behaviour patterns produced by almost any animal.

(a) Nervous Systems

(i) Sensory Information

Before appropriate reactions can be produced on any stimulus it is necessary to measure its intensity position duration and most important character. This is done by sense organs which are usually specialised to receive stimuli of a single modality or character. Thus photoreceptors detect light mechanoreceptors detect mechanical disturbance and chemoreceptors detect specific chemicals. In all cases the sense organs produce a message about the stimulus in the form of nerve impulses (see F30-Cell Membrane) which travel up the nerve from the sense organ to the rest of the nervous system. Change of stimulus intensity is usually signalled as a change in frequency of nerve impulses. The position of the sense organ which is active indicates the position of the stimulus within or without the body. The duration of the repeated discharge of nerve impulses indicates the duration of the stimulus.

(ii) Simple Nervous

The simplest type of nervous system is the network of interconnected nerve cells (neurons) found in the coelenterates. Branching processes of the nerve cells communicate with neighbouring processes at special regions called synapses (F30). Quite complicated behaviour is possible even with this relatively simple system. If a sea anemone is prodded violently it will close up equally violently showing that activity has spread throughout the network. If it is tickled gently it will respond with local contractions around the site of stimulation. The movements of feeding and locomotion are very delicately performed at appropriate times.

(iii) Central Nervous Systems

In the majority of animals all the nerve cells tend to become collected into a solid mass of tissue referred to as a central nervous system (C.N.S.). Within the mass the nerve cells are interconnected via synapses in the same way as in a nerve net. The connections with sense organs and muscles are made via long processes called axons. Numbers of axons are usually bound together with connective tissue to form a nerve trunk. In annelids and arthropods the C.N.S. is seen as a ventral cord lying beneath the gut with a swelling or ganglion in each segment of the body. In molluscs the ganglia are usually more closely grouped around the oesophagus with the possible provision of a pair of ganglia further back in the viscera. Vertebrates possess a dorsal nerve cord which is uniform in diameter and not ganglionated though nerves emerge from it in a segmental fashion. The segmental nerves arise in two separate bundles or roots. The dorsal root is made up entirely of sensory nerves conveying information to the C.N.S. The ventral root consists of motor nerves which convey nerve impulses to the muscles of limbs and alimentary canal together with other effector organs such as glands.

(iv) Reflexes

A reflex in which stimulation of a sense organ or sensory nerve results in the almost immediate contraction of a muscle is the simplest type of C.N.S. activity. Reflexes have been studied in all animals but the best known ones can be seen in frogs cats dogs and sometimes humans. The very simplest is the stretch reflex in which a stretched muscle is made to contract by activity coming into the C.N.S. from stretch receptors in the muscle. The activity is relayed directly to the motor neurones of the muscle concerned making them active and thus causing the muscle to contract. This reflex is monosynaptic i.e. there is only the single synaptic connexion between sensory nerve and motor neurone. The knee jerk in humans is a stretch reflex the stretch being caused by hitting the muscle tendon as it passes over the knee. Much of the recent work on reflexes has been done on this simple system notably by Eccles. The flexor reflex, which is seen as the sudden withdrawal of a limb from any painful stimulus is more complicated. Although the stimuli may vary the withdrawal response is

always accomplished by contraction of flexor muscles which bring the limb in towards the body. The reflex is polysynaptic i.e. several intermediate neurones connect the sensory nerves through to the motor neurones. More complicated still is the scratch reflex in which an animal is made to scratch its flank in response to an irritation or tickling in that region. This reflex demonstrates some of the more involved properties of the C.N.S. For example a dog will continue to scratch for a time after the tickling has stopped so that the C.N.S. must continue to be active in the absence of sensory stimulation. This has been called after discharge.

(v) The Brain

The C.N.S. functions in a more complicated way than is suggested by study of the reflexes and most of these higher activities are co-ordinated by the brain. A greater condensation of neurones is seen at the front end of the C.N.S. of all animals because of the larger numbers of sense organs in that region. Brains which become the dominant part of the C.N.S. can be seen in arthropods molluscs and vertebrates. The close association with sense organs is illustrated by the vertebrate brain which is divided into three regions (a) forebrain (nose) (b) midbrain (eye) and (c) hindbrain (ear and taste). However the brain is much more than a relay station for these stimulus modalities and it receives information from other parts of the body via the spinal cord. All this information is correlated and activity patterns initiated and transmitted to appropriate regions. In lower vertebrates the roof of the midbrain (the optic tectum) is the important correlation centre and its effectiveness has been well established in studies on instinct and learning in fish. Another region of the brain of importance in all vertebrates is a dorsal upgrowth of the hindbrain called the cerebellum. This is a motor co-ordinating centre which ensures that all activities are performed in a smooth and well balanced way by the muscles and limbs of the body. In reptiles the forebrain begins to take over the correlation role and in mammals this development reaches its peak in the cerebral cortex. In man the cortex over shadows the rest of the brain and contains some 1000 000 000 neurones. It is easy to see the magnitude of the problem of understanding a system of this complexity. The bee's brain with far far fewer cells can initiate complicated behaviour such as the hive dances. The possibilities offered by the human cortex seem vastly greater though they are often realised in ways which give cause for concern. At the moment it would be quite impossible to build a computer with the properties of the human brain. To do this in the future would depend on major advances in computer technology and even greater advances in the knowledge of central nervous systems.

(b) Hormonal Regulation

Many aspects of an animal's metabolism are regulated not by the nervous system but by specific chemical signals known as hormones which are circulated in the blood stream. Growth carbohydrate metabolism salt balance activity of ovaries and testes and their associated structures and colour change are all regulated in some way by hormones. The substances are secreted by endocrine glands or ductless glands as they are often called. The important endocrine glands in vertebrates are the thyroid parathyroid adrenal pancreas the sex glands and the pituitary.

In the past the endocrine and nervous systems were regarded as exerting an independent control in slightly different functional areas of the body. It is clear now that the integration of the two systems is much greater than was formerly envisaged and in vertebrates is accomplished through the pituitary gland. Secretions of this gland regulate almost all other endocrine glands and the secretions of the pituitary are either produced in the C.N.S. with which it is directly connected or are controlled by C.N.S. secretions. An astonishing parallel development of other neurosecretory systems such as those of the pituitary has been found in a variety of animals and in all types the neurosecretory organ complex is the dominant endocrine gland of the body. In crustacea the so

called X organ complex found within the eyestall and in insects neurosecretory cells connecting to the corpora cardiaca glands occupy the functional position of the vertebrate pituitary. They all regulate growth, metabolism and reproductive physiology either directly or through the mediation of other endocrine glands.

7 Animal Behaviour

In discussing the nervous system we have already dealt with simple mechanisms such as the reflex. Very much more complicated are the instinctive and learned patterns of behaviour which are studied by animal psychologists and ethologists such as Lorenz and Tinbergen.

(a) Instinct

Instinct is inborn behaviour which does not have to be learnt and is usually performed in a stereotyped way. For example a gull will retrieve an egg taken out of its nest by shovelling it back with the underside of its beak. The gull will never replace an egg in its nest in any other way for example by using a wing or leg and once it has begun a retrieval it will usually continue the movements back to the nest even though the egg is taken away. An instinctive behaviour pattern is triggered off by a particular stimulus or releaser which may be a very small part of the total environment. A male stickleback will attack a very crude model with a red belly but will not attack an exact model without it. The red underside appears to be a much more important stimulus than general shape. A particular instinctive pattern cannot always be elicited and the reaction of an animal very largely depends on when the behaviour was last produced. The longer the time that elapses the easier it is to trigger off the instinctive pattern until eventually it may appear in the absence of an appropriate set of environmental circumstances.

(b) Learning

Learning is that behaviour acquired during the organism's lifetime as a result of experience. Evidence of learning has been seen in many animals from worms upwards though as might be expected the more complicated types of learning are found only in those animals with elaborate nervous systems. A simple type of learning is seen when an animal upon repeated exposure to a stimulus gradually decreases the normal response which is usually one of flight until eventually the response may disappear completely. This process is called habituation. More complex are the conditioned reflexes, which were first discovered by Pavlov. In these an animal can in some way connect a conditioned stimulus such as a bell with an unconditioned stimulus such as meat so that eventually it salivates when the bell is rung. Trial and error learning of the type needed to be successful in running a maze is more complicated still. In this there is a retrospective element because the reward at the end of the maze comes after all the responses. Many animals can run mazes but the white rat has been extensively used in experiments of this nature and there is a huge literature on this one animal. A final category of learning can be called insight learning in this an animal shows evidence of resolving a new problem without trial and error. This type of learning involves the perception of relations between different parts of the environment and though there may be examples in arthropods and molluscs the clearest evidence of it is seen in the behaviour of birds and mammals.

8 Reproduction

A single animal may live for a short or long time, but eventually it dies and the continuance of the species is dependent upon reproduction. Some protozoa, such as *Amoeba*, reproduce asexually by the simple division of the cell to produce two new individuals. Asexual reproduction also occurs in some coelenterates such as jelly-fish, in which there is an alternation of sexual and asexual generations. However, the vast majority of animals only reproduce sexually.

This involves the fusion of two cells—the gametes produced by adult individuals and each zygote thus formed develops into an individual of the next generation. The gametes are of two kinds: the large spherical immobile ova produced by the female gonad or ovary and the much smaller motile sperms produced by the male gonad or testis. The motility of the sperms helps them to reach the passive ovum which contains food reserves to support the early development of the embryo.

Worms—The flat worms particularly parasitic forms have complicated life cycles and many are hermaphrodite i.e. each individual has both male and female organs. Cross fertilisation usually occurs: the sperms from one worm being introduced into the female duct of another. The round worms are unisexual and internal fertilisation also occurs. Of the annelids the polychaete worms are unisexual but the ova and sperms are shed into the sea where fertilisation takes place. However *Lumbricus* and the leeches are hermaphrodite: cross fertilisation takes place and the eggs are laid in cocoons.

Arthropods—Many crustacea are unisexual though the sedentary barnacles are hermaphrodite. Internal fertilisation may occur but in the crabs and crayfish pairing takes place and the sperms are deposited on the tail of the female. When the eggs are shed they become fertilised and remain attached to the abdominal appendages. Most crustacea have motile larval stages into which the eggs first develop. In *Daphnia*, the water flea, parthenogenesis sometimes occurs i.e. the eggs develop without being fertilised. The sexes are separate in the arachnida and there are usually no larval stages except in the primitive king crabs. The insects are also unisexual and the fertilised eggs are laid after copulation. In some e.g. dragon flies an immature nymph similar to the adult is formed but in flies beetles moths and many others the egg hatches into a larval form. This then develops into a pupa from which the final adult or imago is produced. In the social ants nest the workers are sterile females with large heads, reduced eyes and no wings. The males and queens are winged and insemination of the latter occurs during the nuptial flight.

Molluscs and Echinoderms—Most lamellibranchs are unisexual although some species of scallops and oysters are hermaphrodite. There are motile larval forms and in the swan mussel *Anodonta* the larvae develop in the mantle cavity of the parent and when liberated become attached to the gills or fins of fish where they remain parasitic for some time. Some gastropods are unisexual but the slugs and snails are hermaphrodite. In the latter cross fertilisation occurs: the two approaching snails being stimulated to copulate by firing small sharp darts of calcium carbonate into each other. The echinoderms are unisexual and fertilisation takes place in the sea. The egg first develops into a ciliated larval form.

Vertebrates—The sexes are always separate in the vertebrates. In some cartilaginous fish e.g. dogfish internal fertilisation occurs and the eggs are laid in protective sacs. In contrast the bony fish shed ova and sperms into the water where fertilisation takes place. Although pairing may take place in the amphibia fertilisation occurs in water and there is usually an aquatic larval stage. The reptiles, birds, and mammals are independent of water for fertilisation, as copulation takes place and the sperms from the male are introduced directly into the female. Most reptiles and all birds lay eggs with hard shells. Development of the embryo in marsupial mammals begins in the female uterus but is continued in a ventral pouch which surrounds the teat of the mammary gland. In the two living species of monotreme mammals the eggs are incubated in a similar pouch. Finally in the eutherian mammals the embryo develops in the female uterus and is born at an advanced stage.

Diversity of Sexual Reproduction—This brief survey will give some idea of the diversity of sexual reproduction in animals. External fertilisation is

very much a matter of chance and large numbers of gametes are produced which offset the great losses of gametes and embryos that this method involves. Internal fertilisation is more certain and is also independent of external water—an important factor in land animals. In vertebrates particularly there is increase in the care of the young by the parents involving the development of characters of behaviour as well as those of structure. Some fish lay their eggs in holes or nests which are protected by the male. Similarly a few frogs build nests while others carry the eggs about. The eggs of birds require a constant high temperature for their development and they are usually incubated by the parents. After hatching the young are fed and guarded by the parents until they can leave the nest and fend for themselves. In the eutherian mammals the embryos are attached to the uterus wall by the placenta via which food materials pass from the mother. The period of gestation is long and after birth the young are supplied with milk from the mother until they are weaned and can feed themselves. Another feature in mammals is the period of childhood during which they play and learn and are protected and fed by their parents. The internal fertilisation, internal development and care and protection of the young after birth which is so conspicuous in the higher vertebrates results in the reduction of losses during the vulnerable embryonic and young stages and in consequence relatively few progeny are produced by a pair of individuals.

THE PLANT KINGDOM

There are various ways in which the main classes of the plant kingdom can be grouped but a simple up to date arrangement is given in the chart. Vascular plants are often known as the *Tracheophyta* because they all possess woody conducting elements. These are absent in non vascular plants and the bacteria fungi and algae are often called *Thallophyta* i.e. they have a relatively simple plant body or thallus. Many of the bryophytes also possess a thallus but in some there is a stem bearing leaves although a true vascular system is absent. Many thallophytes are aquatic whereas the tracheophytes are mostly land plants in which the development of woody tissues can be related to the attainment of the land habit as the plant kingdom evolved. However the chart should not be taken as indicating the evolutionary relationships of the various groups. It is more a convenient arrangement which reflects the relative complexity of the plant body.

1 Bacteria—This is a vast group of minute organisms of very simple structure. They are spherical or rod shaped and may exist as separate cells some species being motile or as long chains or irregular masses. Their minute size makes the elucidation of their structure very difficult. There is a wall of complex composition and cytoplasm which contains glycogen and fat. Electron microscope studies have revealed the presence of structures which appear to consist of nuclear material. Multiplication is by simple division which may take place very rapidly. For example *Bacillus subtilis* can divide every 20 minutes so that in 8 hours a single cell may give rise to 16 millions. Recent research indicates that a sexual process may also occur. Bacteria can survive unfavourable conditions by producing a

resistant spore within the cell. They do not possess chlorophyll though a few are pigmented. Most obtain their food already formed and are thus either saprophytes or parasites. The saprophytic bacteria occupy a vital position in the living world. They are responsible for most of the decay of dead organic matter and it has been truly said that without them the surface of the earth would soon become completely covered with the dead bodies of animals and plants. Bacteria also play a vital part in the circulation of nitrogen in nature. By breaking down organic material, ammonia is released and ammonium carbonate is formed in the soil. This is oxidised by other bacteria to form nitrates which can be absorbed by plants again. Yet other bacteria can fix atmospheric nitrogen and one species *Rhizobium leguminosum* occurs in the root nodules of plants such as clover and lupins. These plants are often grown on poor soils and ploughed in thus improving the fertility of the soil. The parasitic bacteria are also of great importance as they are responsible for many diseases of plants, animals and man. (See F7(1)).

2 Fungi—This is a large group of plants none of which contain chlorophyll. Hence like the bacteria they are either parasites on other living plants and animals or saprophytes which live on dead organic matter. Some are unicellular aquatic plants but many have a body called a mycelium composed of many branched threads or hyphae. In the higher fungi (e.g. toadstools bracket fungi and puff balls) complex reproductive structures are formed. All fungi produce spores. In the aquatic species these may be motile but the majority form minute airborne spores. The spore output is often very great and a single mushroom may produce 1 800 million spores. Some fungi are serious diseases of crop plants such as potato blight and wheat rust.

3 Algae—These are essentially aquatic plants which contain chlorophyll. They range from microscopic forms to the large seaweeds. The green algae (*Chlorophyceae*) live mostly in fresh water and may be unicellular motile or non motile or filamentous though a few found in tropical seas are more complex. The brown algae (*Phaeophyceae*) are mostly seaweeds which possess a brown pigment fucoxanthin, which masks the green chlorophyll. They include the bladder wracks (*Fucus*) and kelps (*Laminaria*) of our coasts and the seaweeds which form dense floating masses over hundreds of square miles of the Sargasso Sea. Other groups are the red algae (*Rhodophyceae*) mostly seaweeds of delicate form, the unicellular motile diatoms (*Bacillariophyceae*) and the blue green algae (*Cyanophyceae*). All algae possess unicellular reproductive organs. Various types of life cycle occur the most complex being found in the red algae.

4. Bryophyta—These are the liverworts (*Hepaticae*) and the mosses (*Musci*). They are all small plants characterised by a sharply defined life cycle. This consists of an alternation of generations the plant being a gametophyte bearing sex organs. The latter are multicellular the female archegonium containing a single stationary ovum and the male antheridium producing many motile sperms. The latter are released and swim in water to the archegonium where fertilisation takes place. After this a sporophyte is formed

which is always dependent on the gametophyte and never becomes free living. The sporophyte usually consists of an absorbing foot buried in the tissue of the gametophyte and a stalk or seta bearing at the top a single sporangium. In many mosses this is a complex structure with hygroscopic teeth which move apart only when dry thus releasing the minute spores only when conditions are suitable for their dissemination in the air. The bryophytes are of little economic importance and may be looked upon as an evolutionary side line. However they occupy suitable niches in many plant communities and species of the bog moss *Sphagnum* cover large areas where rain fall is high.

5 Psilopsida—This is a small group of primitive vascular spore bearing plants. Its only living representatives are two rare genera of the Southern Hemisphere. However a number of fossil forms are known from the Devonian period. The best known are those found in the chert at Rhynie in Scotland. The plants are excellently preserved, and their internal structure can be easily seen. They were probably marsh plants with prostrate and erect leafless stems although *Asterocylon* had simple leaves.

6 Sphenopsida—The only living members of this group are about twenty five species of horse tails (*Equisetum*). In the Carboniferous period many tree forms existed (e.g. *Calamites*) the remains of which are very common in coal deposits.

7 Lycoposida—In the Carboniferous period the tree clubmosses were also prominent members of the forests (e.g. *Lepidodendron*). They often reached 100 ft. in height, were branched or unbranched and had large simple leaves. They also had extensive root systems. The only living members belong to a few genera of small herbaceous clubmosses such as *Lycopodium* and *Selaginella*. Like the true mosses they have an alternation of generations but the elaborate plant with stem leaves and roots is the sporophyte and the gametophyte is very small. In *Lycopodium* only one kind of spore is produced, and the resultant gametophyte is bisexual. *Selaginella* produces numerous small microspores which give rise to the very reduced male gametophytes and motile sperms and the few large megaspores which produce the female gametophytes. The latter are formed within the megaspore wall, which splits to allow the sperms to reach the small archegonia.

8 Filicinae—These are the true ferns which in some classifications are put with the horsetails and clubmosses in the Pteridophyta or vascular cryptogams (i.e. vascular plants without seeds). The ferns have a long fossil history and remains very similar to the living Royal ferns (*Osmunda*) are known from the Carboniferous. The ferns are widespread and particularly abundant in tropical forests. The majority are herbaceous perennial plants but a few are aquatic and there are some tree ferns which may reach 20 ft. in height. Most ferns possess a stem bearing roots and large leaves or fronds. The plant is the sporophyte and produces numerous spores in sporangia borne on the fronds. Each spore gives rise to a minute green free living gametophyte known as the prothallus which bears the archegonia and antheridia. After fertilisation a young sporophyte develops which at first draws nourishment from the prothallus. Thus as in the *Bryophyta* external water is essential for the motile sperms to swim in, and there is a clearly defined alternation of generations but the sporophyte is a complex independent plant and the gametophyte is reduced though free living.

9 Gymnosperms—These were the dominant land plants in the Mesozoic era, although fossil remains are found as far back as the Devonian. The living members still form large forests in the North Temperate regions. They are mostly tall evergreen trees with roots stems and small leaves. The conifers include the pines (*Pinus*)

larches (*Larix*) and yews (*Taxus*). The cycads are a rare group of tropical plants with thick unbranched trunks and large fern like leaves. The maiden hair tree of Japan (*Ginkgo biloba*) has also had a long geological history. Another interesting Gymnosperm is *Metasequoia* a genus well known to palaeobotanists. In 1948 a few living specimens were found in a remote area of China. Seeds were collected and plants are now being grown in botanical gardens all over the world. The Gymnosperms are characterised by the production of naked seeds which are usually borne on cones. The male pollen grains which are equivalent to the microspores of *Selaginella* are carried by wind to the ovule of the female cone. The pollen germinates and the pollen tube carries the male gametes to the reduced archegonia borne on the female prothallus which unlike those of the ferns is retained within the ovule on the parent plant. After fertilisation an embryo is formed the prothallus becomes the food store or endosperm and the outer part of the ovule becomes the seed coat. The cycads and *Ginkgo* retain a primitive feature in that the male gametes are motile and they swim to the archegonia from the pollen tube.

10 Angiosperms—The apparent sudden rise of the Angiosperms in the Cretaceous period is still the abominable mystery it was to Darwin. Various suggestions have been put forward but nothing definite is known about the origin of the group. The Angiosperms or flowering plants are now the dominant group over most of the land surface of the earth, and at least 250 000 species are known. Apart from the natural vegetation the majority of our crop and garden plants are Angiosperms. They occur in every type of habitat and range in form from gigantic trees to minute plants such as the duck weeds. Some are climbers others succulents and a number have reverted to the aquatic habit. Although most possess chlorophyll a few are partial (e.g. *Mistle* to) or complete parasites (e.g. *Dodder*).

Flower, Fruit and Seeds—The diagnostic feature of the group is the production of seeds which are completely enclosed within the female part of the flower the ovary. Basically a flower is a short reproductive shoot which bears several whorls of lateral organs. At the base are several often green protective sepals forming the calyx and above this are the often brightly coloured petals of the corolla. Within this are the stamens of the androecium or male part of the flower. Centrally is the female gynoecium of one or more carpels containing the ovules. The parts of the flower may be free as in the buttercup or fused together. In many species the petals are fused (sympetalous) the stamens are borne on the corolla (epipetalous) and the carpels are fused to form a compound gynoecium (syncarpous). The stamens possess anthers which produce pollen grains. These are shed and carried by insects or wind to the receptive stigmas of the carpels. Each produces a tube which grows down the style to the ovary and enters an ovule. The ovule is a complex structure containing an ovum and a primary endosperm nucleus. Two male nuclei are discharged from the pollen tube one fuses with the ovum and the other fuses with the primary endosperm nucleus. After this double fertilisation an embryo is formed which is embedded in the nutritive endosperm and the outer tissues of the ovule form the seed coat or testa. The ovary of the carpel develops into the fruit containing the seeds. Fruits are of various kinds being either dehiscent and opening when mature to release the seeds or indehiscent with a succulent or dry wall. The indehiscent fruits are shed as a whole and often contain only a single seed. Seeds and fruits show great variation in structure and often have adaptations assisting dispersal. Some have hairs or wings which aid wind dispersal, whereas others have hooks or are sticky and are transported by animals. Some have flotation devices and may be carried a great distance from the parent plant by water. Seeds vary in size from the microscopic seeds of orchids to those of the double coconut which may weigh 30 lb. Only about 10% of the weight of a seed is water and the embryo although alive is dormant. The bulk of

a seed consists of stored food material commonly fats or starch and proteins which may be contained in the endosperm surrounding the embryo although in some species the endosperm is absorbed during seed development and the food is stored in the one or two swollen seed leaves or cotyledons of the embryo.

Classification of Flowering Plants—John Ray (1627-1705) was the first botanist to recognise the two great divisions of the Angiosperms—the dicotyledons with two seed leaves and the monocotyledons with only one. This primary division of the flowering plants has stood the test of time and is still recognised. Other differences are also found between the two groups. The dicotyledons usually have net veined leaves and the floral parts are in fours or fives whereas the monocotyledons usually have leaves with parallel veins and the floral parts are in threes.

ECOLOGY—THE STUDY OF LIVING ORGANISMS IN THEIR ENVIRONMENT

So far we have examined biological organisation at the level of the cell through to the whole multicellular organism. The important branch of biology which deals with the relationship between living organisms and their environment must now be considered. Living organisms and the physical environment in which they exist form what is termed an ecosystem. Obviously it would be possible to regard the whole world as a giant ecosystem though for purposes of study it would be extremely unrewarding and impractical to adopt such an extreme attitude. A pond, a rocky or sandy shore, a forest and a peat bog are examples of ecosystems on a somewhat smaller scale possessing different properties and containing populations of animals and plants that are different both in number of individuals and in species represented. The ecologist seeks to understand why a particular species is present in certain numbers in an ecosystem in terms of that species' interaction with all other living organisms (biotic factors) and with the physical (abiotic) factors of the ecosystem.

1 Abiotic Factors

All living organisms will show ranges of tolerance for abiotic factors such as temperature, humidity, salinity, oxygen levels, amount of light, etc. Clearly if any factor in the environment moves outside the range of tolerance of a species it becomes limiting for that particular species which is then excluded from the environment. Within the range of tolerance there will be an optimum value for each abiotic factor at which a species will survive best.

There is not a firm line separating suitable and unsuitable environments but rather a steady shift from optimum values into conditions in which an organism finds it more and more difficult to survive. The interaction of different abiotic factors in an environment produces a complex situation which will make the environment suitable for one species but will exclude another species having slightly different abiotic optima from the first even though the conditions are not outside the tolerance ranges of either species. Thus trout and carp show considerable overlap in the ranges of temperature, oxygenation of the water, and speed of water current in which they can survive and it is possible for both species to live in the same pool or tank. In the wild however they tend to form part of different ecosystems because trout have a lower temperature optimum, need more oxygen, and are more active than carp. Trout are found in rapidly flowing cool unpolluted chalk streams whereas carp live best in shallow lakes which are somewhat warmer and rather stagnant.

One of the most important abiotic factors in an environment is the nature of the substrate upon or within which an organism moves and settles.

(a) **The Terrestrial Environment**—Soil is the commonest substrate for terrestrial organisms.

Particle sizes ranging from the coarsest gravel soils through sands and silts to the finely textured clays, have extensive effects on the flora and fauna of any area. Coarsely textured soils are obviously penetrated most easily both by roots and by soil animals. Soils of this type also allow the rapid movement of water and soil gases but they have the serious disadvantage of poor water retention. The level at which water saturation occurs is known as the water table and is an important abiotic factor. The terrestrial environment tends on the whole to dehydrate organisms and there is always a marked dependence on water supplies.

Soil characteristics also vary with depth. A vertical section through any soil is referred to as its profile and has considerable bearing on the ecosystems in which the soil is involved. The layers or horizons of a soil profile vary enormously from one soil to another. Below a surface layer of organic debris one can in general terms distinguish a layer of soil from which substances have been leached (A horizon) soil containing the leached out substances from the layer above (B horizon), the weathered parent material (C horizon) and finally the parent rock, or some other stratum beneath the soil (D horizon).

Humus which is formed from animal and plant remains and is located in the lower parts of the A profile is of great importance in providing food for soil organisms and chemical elements such as nitrogen, phosphorus and calcium for plant growth. It is also important in maintaining good soil structure and though inorganic fertilisers can supply chemical elements they have little or no effect on structure. Soil requires careful cultivation and structure is easily disturbed by such things as heavy farm machinery. The smearing of soils by spinning tractor wheels as wet land is ploughed or the winter harvesting of crops such as sugar beet in adverse conditions eventually leads to the creation of impermeable layers with the disastrous exclusion of oxygen and oxygen-consuming organisms.

(b) **The Aquatic Environments**—Marine and freshwater environments together cover more than 75 per cent of the earth's surface and since they can be occupied throughout their entire depth, offer a much greater volume of living space than does the land. There is only a slight difference between the density of water and of living tissues, so that the bodies of aquatic organisms are very largely supported by the environment and do not need strong woody stems or powerfully muscled limbs to hold them up. Water has a high specific heat which means that large amounts of heat are needed to raise its temperature. The result is that aquatic environments tend to show much smaller fluctuations in temperature than the terrestrial ones. In general, the larger the volume of water the smaller are the fluctuations in temperature and so the fauna and flora of the oceans will not show wide temperature tolerance whereas that of small pools will but in neither case will the tolerance be so great as that shown by many terrestrial forms. Oxygen and carbon dioxide concentrations are very different in water and in air and this has led in animals to the development of gill systems for gas exchange rather than the lungs, or lung type structures of terrestrial forms. Gas concentrations are also variable from one aquatic environment to another making them suitable for the support of different fauna and flora.

An important difference between the sea and freshwater is seen when their salt concentrations are determined. This is usually done experimentally by measuring the temperature at which the medium freezes, because a well-established relationship exists between the salt concentration in a solution and the extent to which the freezing point is lowered below that of the solvent (in this case distilled water) alone. Thus, freshwater freezes at 0 °C or just below whereas sea water with its high salt content freezes at -1.9 °C and a mixture of half fresh and half sea water freezes at -0.95 °C. Organisms living in fresh or in sea water face quite dissimilar problems in osmotic and ionic regulation. Life evolved originally in the sea and the salt concentration in the blood of marine molluscs, crustaceans and echinoderms,

for example produces precisely the same freezing point depression as does sea water itself. Marine organisms have on several occasions in the course of their evolution moved into freshwater. The representatives of the worms, crustaceans, molluscs and vertebrates have all independently invaded this very dilute habitat. What is more all these animals show approximately the same types of modification to cope with the change. Their outer layers in the main become impermeable and the salt concentration of their blood is reduced considerably (to a freezing point of -1.0°C in fish and to a spectacularly low level in the fresh water mussel depressing the freezing point to a mere -0.2°C). The kidneys become enlarged and produce a large volume of dilute urine. By these means freshwater animals can cut down loss of their salts to the dilute medium and can also remove the large volume of water that enters their bodies by osmosis. It is interesting that all terrestrial vertebrates including the mammals have retained a salt concentration in their blood of about half the seawater level and this is partly attributable to their freshwater ancestry. The transition between seawater and freshwater was achieved via brackish water estuaries and the organisms which live under brackish water conditions today are of great interest in showing how tolerance of substantial fluctuations in salinity can be achieved. The ultimate development of salinity tolerance is seen in such animals as the salmon and eel which move from fresh to salt water and back again during their life cycle.

2 Biotic Factors

(a) *Associations between Organisms*—No organism can be considered to be independent of any other organism in an ecosystem but in some cases close associations of various types can be developed between different species or different members of the same species.

Commensalism is an association which benefits one member but has little effect on the other. Small organisms can live within the protective covering offered by a larger individual as for example commensal crabs living within the shell of some species of oyster.

Symbiosis is a somewhat closer association in which both members benefit as do certain species of green algae and the coelenterates in whose body tissues they live. The algae are protected and the coelenterates benefit from the food produced by the photosynthetic plant. Some symbiotic organisms are unable to survive outside the association. The lichens which are associations of algae and fungi are examples of this type of symbiosis as are some of the food processing micro organisms together with the animals in whose intestinal tracts they live.

Social animals In some cases animals of the same species form social groups in which co-operative effort and division of labour makes them more successful in exploiting a particular environment. Social development is most obvious among certain insects such as termites, ants, wasps and bees and among the vertebrates. Social organisation in these groups may lead to the development of different behaviour patterns and ultimately as in ants and bees for example to the evolution of a variety of structural modifications so that different castes are recognisable.

Parasitism Not all associations are of mutual benefit and when one organism becomes sufficiently specialised so that it can live successfully on materials extracted from another the latter is always adversely affected. Parasites by causing disease in and sometimes the death of the host can influence population growth and size. Important groups are bacteria, protozoa, fungi, nematodes (roundworms) and plathelminths (tapeworms and liver flukes). Viruses are also important disease producing agents which are incapable of an independent existence outside the cells of the host and utilise the host cell's metabolic

pathways directly to synthesise new virus material.

Many parasites (and other pests which may disturb the comfort and health of man) can now be controlled to some extent and for a variety of reasons such control procedures have extensive effects on the ecosystems involved. The regulation of some bacterial parasites by means of antibiotics and control of the insect vectors of organisms such as the malarial parasite by means of insecticides have both been important factors in the increase in human population. Though the beneficial effects of pest control of all types are clear the process is not without its difficulties and dangers. Indiscriminate use of many chemical agents has led to the development of resistant strains. In any group of organisms some will naturally be more resistant to a pesticide or antibiotic than others and these will be the survivors of any treatment that is less than totally effective. They will form the breeding stock for subsequent generations and so progressively more and more resistant types will evolve. Thus there are now many strains of bacteria resistant to penicillin and other antibiotics. Even more alarming is the recent discovery that this resistance can be transferred in an infective way between bacteria of different species. Another complication associated with chemical control is that the agent concerned frequently affects a wide spectrum of organisms including those that are in no sense injurious to man or his crops. Thus DDT kills bees and other pollinating insects unless its application to a crop is very precisely timed. In addition the accumulation of quantities of chlorinated hydrocarbons such as DDT in the environment is known to have an injurious effect on organisms other than insects. Because these chemicals are broken down very slowly they now form a serious problem in environmental pollution.

Predation A less direct association than that between parasite and host is the one which exists between predators and the prey which they capture and kill. However interactions in both parasitism and predation have features in common particularly those affecting population numbers. If the abundance of prey increases the effort and time required for a capture is reduced so that the rate of predation must also go up. Eventually however predators do not respond to further increases in prey because they are satiated or for some other behavioural reason. A maximum predation rate is reached in a population of a certain size. Increased prey density also tends to result in larger numbers of predators produced either by aggregation from outside areas or by increased reproduction rate. The density of predators then begins to have its limiting effect on the rate of predation. The total response may lead to stability in numbers but more often periodic oscillations in the number of both predators and prey are seen.

(b) *The Food Factor*—Plants are the ultimate source of organic food for all animals. The most important food plants are those capable of photosynthesis (F28) in which organic material is synthesised from carbon dioxide and water using radiant energy from the sun to drive the reaction.

Food Chains Plants are eaten by herbivores which in turn are eaten by carnivores. It is possible to see many such sequences called food chains in all ecosystems. For example in the open sea green algae are the important photosynthetic organisms; these are eaten by a small crustacean *Calanus* which in turn forms a large part of the diet of the herring. Feeding relationships are usually of much greater complexity than is suggested by a simple food chain. Thus *Calanus* represents about 20 per cent of the herring's diet but it is also eaten by many other marine animals as well. For example it forms about 70 per cent of the total diet of larval sand eels. The larval eels are eaten in turn by the herring and may form 40 per cent of its diet. Because an animal's diet is usually quite varied and one species of animal or plant may be part of the food of a wide range of different animals interactions are set up which are referred to as

food webs The more knowledge there is about a particular food web, the more complex it becomes. However, for general comparative purposes it is possible to disregard the detail of species and to group together all organisms with similar food habits. When this is done a relationship known as pyramid of numbers often appears in which organisms at the base of a food chain (the primary producers) are extremely abundant while those at the apex (the final consumers) are relatively few in number.

Productivity The validity of using numbers of individuals in such an analysis is often open to question especially when ecosystems are to be compared. For example a comparison between numbers of herring and numbers of whales as final consumers in two pyramidal systems is not very informative. This difficulty is partially overcome by using estimates of the total weight (biomass) of organisms at each level rather than their number. Even this has disadvantages. Because determinations of biomass give a measure of the amount of material present at any one time (the standing crop) but give no indication of the amount of material being produced or the rate of its production (the productivity). In some parts of the sea, for example the biomass of small animals forming the zooplankton is greater than that of the plant life or phytoplankton on which it depends for food. This seems to contravene the pyramid concept. However the rate of production of new material by the phytoplankton is very much greater than by the zooplankton so that if taken over a year the total amount of plant material produced would far exceed the total production of animal material. Productivity is a concept of great practical and theoretical importance. It may be determined in terms of the actual organic material produced in an area over a set period of time or more usefully in terms of the amounts of energy transferred and stored at each food level again over a set period of time.

Under natural conditions only 1 to 5 per cent of the light falling on a plant is converted by its photosynthetic system into chemical energy contained in the material of its tissues. Similarly herbivores which consume plants will pass on to their predators only some 10 per cent of the energy contained in the plant material they eat. These low values for photosynthetic efficiency and ecological efficiency respectively are due to the fact that most of the energy appears as heat during the metabolic reactions needed to sustain life and only a small amount is incorporated into new tissue. It is easy to see that the form of a pyramid of numbers can be explained in terms of low ecological efficiency as can the observation that a food chain rarely has more than five links. The loss of energy at each stage must mean that each succeeding stage becomes smaller and smaller in number and that the number of stages is severely limited.

Human Population and Food The present very large increase in human population and the predicted rise from 3 800 million in 1968 to 6 000 million in the year 2000 has led to a pressing need for the controlled exploitation of food resources in the world. Consideration of the processes of energy transfer suggests that man should be mainly herbivorous. They also suggest that present agricultural crops with the possible exception of sugar cane do not achieve as high a primary productivity as that encountered in some natural ecosystems. Crops rarely achieve complete plant cover of the land throughout the growing season so as to trap the maximum amount of sunlight. It would be necessary to mix crops to do this effectively and there would then be complicated harvesting problems.

If man remains an omnivore as he almost certainly will then his domestic food animals will continue to be herbivorous as they are at present though whether they will be the same herbivores is less easy to predict. Beef cattle raised on grass land convert only 4 per cent of the energy in the plants of their environment into similar chemical energy in their tissues. At the present time

intensive farming practices are being employed to improve conversion usually by harvesting plant material processing it and bringing it to the animals which are housed in special buildings. This cuts down on the wastage of plant food because it can be grown under better conditions and less of it is consumed by animals other than the cattle. Careful breeding and the limitation of the period over which livestock is raised to that of maximum growth efficiency have also contributed to conversions of some 35 per cent achieved in the case of broiler chickens and calves. The moral problems raised by these methods and the circumstances which make them necessary give rise to widespread concern.

Fish are also an important part of man's diet and again an understanding of the ecology of food fish is important in running efficient fisheries. Many populations have been overfished so that returns have gone down in spite of intensified fishing effort. The fisheries scientist is concerned to discover the limit at which the maximum number of fish can be taken without depleting the population year by year. Research is also going on into possible methods of enclosing and farming areas of the sea or estuaries.

Population Dynamics

Factors such as those outlined above interact to determine the size and character of any population of living organism. Study of the numbers of organisms in a population together with their change and regulation forms a branch of the subject of considerable practical importance known as population dynamics.

Numbers of animals and plants tend to increase up to the capacity of the environment at which stage some essential resource will exert a limiting effect. The rate of increase will be determined by the balance between reproduction rate and mortality. As Malthus appreciated adults of any organism tend to replace themselves by a greater number of progeny and in the absence of losses by mortality and other factors there is a vast potential for increase in all populations. If an organism doubles its number in a year there will be a 1 000 fold increase in 10 years and a 10 million fold increase in 20 years. Increase of this type soon leads to shortages and overcrowding so that mortality goes up, the net rate of increase diminishes and finally an equilibrium is reached with no further increase in number. The change from low to high numbers with the passage of time follows an S shaped curve starting slowly becoming faster and faster and then slowing down to equilibrium.

When a population reaches equilibrium the numbers are kept at a steady level by factors such as competition for food, refuge or space. These factors are said to be density dependent because greater numbers in the population intensify the competition and increase mortality. Lower numbers decrease competition and favour survival. Abundance is therefore regulated by density dependent processes arising from interactions first between individuals making up the population and secondly between the population under consideration and other populations whose members may be competitors, predators or food. The level of abundance at which this regulation occurs may vary greatly and will be determined at least in part by general environmental factors such as temperature, rainfall, amount of sunlight, the nature of the vegetation and so on.

Human population is increasing rapidly at the present time mainly because of the fall in death rate. Food production is also increasing but in some areas of the world supply and requirement are so evenly matched that drought or war are inevitably followed by a famine. Though the human population has not yet reached the stage of equilibrium, it is clear that ultimately it must be subject to forces of regulation similar to those that control populations of other organisms. Birth rate cannot exceed death rate indefinitely in any living organism. By limiting the size of families it is possible for man to achieve a population equilibrium at levels lower than those at which regulative factors such as famine or aggression must

begin to operate. Rational control of birth rate seems to offer the best chance of averting a global population disaster.

THE GEOLOGICAL RECORD

The various stages in the history of the earth can be read by the geologists in the strata or layers of rock laid down since the planet began to solidify and it is in these rocks, too, that the record of life upon earth may be traced.

No Life Rocks—The earliest rocks in the record are known as the Azolic (no life) rocks because they show no trace of living things, and these layers are of such thickness that they occupy more than half of the whole record. That is to say for more than half of the earth's history nothing living existed upon any part of the globe. For millions of years the surface of our planet was nothing but bare rock without soil or grass swept by hot winds exceeding in violence the wildest tornadoes of today and drenched by torrential downpours of tropical rain which, as we have seen elsewhere, gradually tore away the surface to form sandy sediments at the bottom of the seas. In such ancient rocks pushed above the surface by later upheavals we can still trace the marks of primeval oceans as they rippled upon the barren shores or of raindrops which left their imprint perhaps 1 500 million years ago.

Primitive Sea Life—As we move upwards through the strata, however, traces of life begin to appear and steadily increase as we come to the more recent levels. The earliest signs appear in what is known as the Early Paleozoic Age (or by some writers as the Proterozoic Age) when we find the fossilised remains of small shellfish, sea weeds and trilobites—the latter were creatures somewhat like the plant life of modern times. All these primitive animals and plants lived in the shallow tidal waters of ancient seas, for as yet life had not invaded either the dry land or the deep oceans. It is of course clear that these creatures of Early Paleozoic times were not the first living things; they were merely the first creatures capable of leaving fossilised remains and without doubt must have had more primitive ancestors—ameba-like forms, jellyfish, bacteria, and so on, whose bodies were too soft to leave any traces in the record of the rocks.

The Age of Fishes—Towards the end of the Early Paleozoic Era, in what we now know as

the Silurian period there arose a new form of life—the first backboneed animals—primitive fishes somewhat similar to the sharks of today—and in the division of the Upper Paleozoic Era known as the Devonian they had come to multiply so greatly that this is frequently described as the Age of Fishes.

First Land Animals and Plants—It is about this time too that we begin to find traces of animal and plant life upon the dry land. Both animals and plants had acute problems to solve before it became possible for them to live out of water, for both animals and plants had hitherto been supported by the surrounding water and respired by removing oxygen dissolved in the water. In land animals this problem was solved by a long series of adaptations from gills to lungs. Plants were able to invade the land because of the evolution of an impermeable outer cuticle which prevented water loss and also the development of woody tissues which provided support and a water conducting system for the whole plant body.

Amphibia and Spore-bearing Trees—The first type of vertebrates (backboneed animals) to live upon dry land was the group of amphibia in the Carboniferous Age which is today represented by the newts, frogs, toads and salamanders. In all these forms the eggs give rise to a tadpole stage with gills which lives for some time entirely in water. Later the gills gave place to a primitive form of lung which enables the animal to live upon land. Even so, amphibia are restricted more or less to swampy or marshy land and without a damp environment they would dry up and shrivel to death. The most abundant forms of plant life in the Carboniferous period were the tree-like horsetails, clubmosses and ferns, the fossilised tissues of which are found in the coal measures and are burned as household coal. But these plants also, as in the case of the amphibia, could exist only amongst the swamps and marshes and life although it had freed itself from the necessity of existence in the waters of the earth still had to return to the water in order to reproduce itself. The highlands and the deeper waters of the planet were still empty of living things. Although the Carboniferous period had been a period of warmth and abundance the Paleozoic Era came to an end with a long cycle of dry and bitterly cold ages. Such long term climatic changes were due, it is now supposed, to such factors as changes in the earth's orbit, the shifting of its axis of rotation, changes in the shape of the land masses and so on. Long before the Ice Ages of more recent times there are records in the rocks of alternating periods of warmth and

THE GEOLOGICAL TIME SCALE

ERAS	PERIODS	AGE (millions of years)	LIFE
CAENOZOIC	Pleistocene	1	Man
	Pliocene		
	Miocene	25	Birds, Mammals and modern plants
	Oligocene		
	Eocene	70	Molluscs
MESOZOIC	Cretaceous	135	Dinosaurs, Cycads, Earliest Birds, Ammonites and Sea urchins
	Jurassic	180	
	Triassic	225	
PALAEOZOIC	Permian	270	First mammals, Early reptiles
	Carboniferous	350	Amphibians, tree-ferns, first insects
	Devonian	400	Fishes, first land plants
	Silurian	440	Mainly invertebrate animals, no life on land, Trilobites and graptolites
	Ordovician	500	
	Cambrian	600	
PRE-CAMBRIAN (also PROTEROZOIC, ARCHAEOZOIC)		2 000	Life emerges
		5 000	Age of Earth

cold as far back as the Azoic and Early Paleozoic Eras. This long cold spell at the close of the Paleozoic era came to an end about 220 million years ago and was succeeded by a long era of widely spread warm conditions—the Mesozoic Era, the so called Age of Reptiles.

The Mesozoic Era.—The reptiles first appeared in the Permian but it was during the Mesozoic era that they became the dominant group of animals. The giant reptiles included the stegosaur and the gigantosaur the diplodocus and many other kinds which were far larger than any land animals living today. Some for example the diplodocus were 100 ft long although they were vegetarian in habit and were preyed upon by other almost equally huge flesh eating reptiles. Some species such as the plesiosaurs and ichthyosaurs became secondarily aquatic while the pterodactyl possessed wings with which it could glide and perhaps fly short distances. However they all differed from the amphibia in that they had hard dry skins their lungs were more efficient fertilisation was internal due to the development of copulatory organs and they laid eggs with hard protective shells.

It was also during the Mesozoic era that the warm blooded birds arose. The birds like the reptiles lay eggs with hard shells and they have several internal features found in the reptile. The fossil bird *Archaeopteryx* three specimens of which have been found in Germany lived in the Jurassic period. Although it was obviously a bird it retained many reptilian features. Earliest mammals are recognised in rocks of the late Paleozoic but in the Mesozoic considerable evolution of the group took place. The fossil *Tribulocetus* which are also found in the Jurassic are believed to be related to forms from which both the marsupial and placental mammals arose. Although insects were present as far back as the Carboniferous it was in the Mesozoic that many of the groups we know today first appeared.

Great changes also took place in the plant cover of the land during this era. The spore bearing giant horsetails and tree clubmosses declined and were replaced by gymnosperms—trees bearing naked seeds. One large group of these the cycadeoids have become extinct but the conifers and a few of the once abundant cycads still remain. The flowering plants or angiosperms also made their appearance and towards the end of the Cretaceous their evolution was extremely rapid. In fact many of the fossil leaves found in rocks of Cretaceous age are indistinguishable from those of some present day flowering plants.

A New Era.—But perhaps 150 million years later all this seemingly everlasting warmth and sunshine the lush tropical life the giant reptiles who had ruled the world were wiped out by a new period of bitter cold which only the hardy species could survive. A new Era known as the Cenozoic was beginning ushered in by a period of upheaval and volcanic activity following which the map of the world came to resemble more closely the picture we know today. The cold period may have lasted several million years and the main species to survive it were those which had come into existence towards the end of the Mesozoic Era the seed bearing flowering plants the birds and the mammals. The once all powerful reptiles from this time onwards are represented only by the comparatively few and relatively small reptilian species of today the snakes lizards crocodiles and alligators. It was at this time, too that long after the creation of the mountains of Scotland and Norway (the so called Caledonian revolution) or even of the Appalachian mountains (the Appalachian revolution) there arose the great masses of the Alps the Himalayas, the Rocky Mountains, and the Andes. These are the mountain chains of the most recent the Cenozoic revolution. Initially as we have seen, the climate of the Cenozoic Era was cold, but the weather grew generally warmer until a new period of abundance was reached only to be followed at the end of the Pliocene by a period of glacial ages generally known as the First, Second, Third, and Fourth Ice Ages.

THE EVOLUTION OF ORGANISMS

Introduction.—It is commonly thought that the great 19th cent. naturalist Charles Darwin was the first person to suggest that life had continually evolved. However the idea that species of living organisms could change over long periods of time was considered by some Greek writers and much later by the Frenchmen Buffon and Lamarck at the end of the 18th cent. Further the work of the 18th cent. geologists such as James Hutton and William Smith provided a basis without which Darwin's contribution would have been impossible. Hutton showed that the earth's surface had undergone prolonged upheavals and volcanic eruptions with consequent changes in sea level. This implied that the earth was much older than had previously been supposed. Smith developed a method of dating the geological strata by means of the fossils found in them and demonstrated that widely different types of animals and plants existed at different periods of the earth's history. As described in the previous section a general picture is presented of the evolution of organisms from the simple to the complex and from the aquatic to the terrestrial environment. These discoveries were in conflict with the Biblical account in the book of Genesis and although various attempts were made to explain them away or discredit them, it became abundantly clear that through millions of years life has been continually changing with new species constantly arising and many dying out. Before considering Darwin's major contribution to the theory of evolution it will be appropriate to outline briefly the various lines of evidence which indicate that in fact evolution has taken place.

The Evidence for Evolution —

1 *The Geological Record.*—It has already been pointed out that successively younger rocks contain fossil remains of different and relatively more complex organisms. The spore bearing plants preceded the gymnosperms and the angiosperms arose much later. Similarly in the vertebrate series the fish appeared before the amphibia which were followed by the reptiles and later by the air breathing warm blooded birds and mammals. On a more restricted level the rocks provide even greater support for the occurrence of evolution. For example the evolution of the horse has been worked out in great detail from the small *Eohippus* which was about a foot high and had four digits on the forefeet and three on the hind feet to the large one toed animal living today. However such complete series are rare and the geological record is very incomplete. There are a number of gaps particularly between the major groups of organisms. No satisfactory fossil evidence is known of the ancestors of the angiosperms (F40) and although some may be discovered it could be that they did not grow in conditions which favoured their preservation as fossils. On the other hand *Archaeopteryx* provides an indisputable link between the reptiles and the birds.

Another important point should also be made about the geological record. Although we talk about the age of fishes the age of reptiles and so on it must be emphasised that these are the periods during which particular groups were abundant or even dominant. Each group probably originated many millions of years before it became widespread. Further some groups such as the giant reptiles and the seed ferns died out completely whereas others the fishes and true ferns for example, are still common today. However even in the latter groups there is evidence that they have continued to evolve so that many fishes and ferns that exist today are very different from those of the Devonian and Carboniferous periods (F44). On the other hand the geological record also shows that some species for example the Maiden hair tree have remained unaltered for many millions of years.

2 *Geographical Distribution.*—Nearly all the marsupials or pouched mammals are found in the Australian continent which was cut off from the mainland about 80 million years ago. All the

fossil evidence indicate, that at that time the eutherian or placental mammals did not yet exist. The marsupials are the only naturally occurring mammals in Australia (F33(2)) but since the isolation of the continent the group has given rise to a large number of species very similar in appearance to those which evolved elsewhere in the world among the eutherian mammals. There are marsupials which look like wolves, dogs, cats, and squirrels, yet they have no close biological relationships to these animals. Further, some marsupials such as the kangaroos have evolved which are unlike any other creatures in the rest of the world. Quite clearly the isolation of Australia so long ago has resulted in the evolution of these distinct types. A similar small scale effect of isolation was studied by Darwin in the Galapagos islands where each has its own distinct flora and fauna which differ also from those of the S. American mainland.

3 Anatomy—The comparative study of the development and mature structure of the mammalian body provides much evidence that all the species have evolved from a single ancestral stock. Although the arm of an ape, the leg of a dog, the flipper of a whale and the wing of a bat appear very different externally they are all built on the same skeletal plan. It would be difficult to explain such similarities unless they had all evolved from a common type. There is also evidence that the early development of an animal recapitulates its biological history to a certain extent. For example, the gill slits found in fish are formed during the early stages in the development of a mammal although later they disappear. Finally, apparently useless vestigial structures sometimes occur which would be inexplicable unless regarded in the light of an evolutionary history. In man a small appendix and vestiges of a third eyelid occur but these are functionless although in other animals such structures are well developed and functional, e.g. the appendix in the rabbit.

4 Human Selection—During his brief history on earth modern man has continually selected and bred animals and plants for his own use. We have only to look at the various breeds of dogs which have been developed from a single wild type to see that under certain circumstances great structural divergence can occur in a species even in a relatively short time.

The Darwinian Theory of Evolution—Darwin amassed a great deal of information such as that outlined above which convinced him that evolution of life had taken place over millions of years. His was the first real attempt to collect all the evidence scientifically and no other satisfactory alternative explanation of all the facts he presented has been proposed. Perhaps even more important was his attempt to explain how evolution had actually occurred. He published his theory after many years of work in his book *The Origin of Species by Means of Natural Selection* in 1859. Some of his ideas have since been modified owing to our increased knowledge of genetics but they are so important that it is worth while recounting the main points of his theory.

1 The Struggle for Existence—It is clear that in nature there is a severe struggle for existence in all animals and plants. Over a period of time the number of individuals of a species in a given community does not vary greatly. This implies that the number of progeny which survive to become mature breeding individuals more or less replaces the number of mature ones that die. Generally speaking the reproductive output of a species is much greater than this. For example, a single large flower plant may produce half a million seeds, each one of which is potentially capable of giving rise to a new individual. Obviously nearly all the progeny die before reaching maturity and the chance of any single one surviving is very remote.

2 Variation—The individuals of any generation of human beings obviously differ from one

another and such differences are found in other organisms. No two animals of the same species (except perhaps for identical twins) are exactly alike and when a large number of individuals are examined it is clear that they vary considerably in structure, colour, activity and so on. Darwin also pointed out that generally these variations were passed on from one generation to the next, for example the children of tall parents tend to grow tall.

3 Survival of the Fittest—If there is an intense struggle for existence in their natural environment among individuals of a species having different characteristics, those which are best fitted to a given set of conditions are most likely to survive to maturity. These will reproduce and the features which enabled them to survive will be passed on to their offspring. This process is liable to continue and a species will become better adapted to its environment.

4 Natural Selection—Over a long period of time the environment of a given species is never stable but will change in various ways. As it does so the characters which best fit the individuals to the changed environment will be selected (not consciously of course) and the species will change. The environment may change only in part of the range of the species and thus lead to divergence and the production of a new species alongside the old one.

Darwin and Lamarck—Darwin pictured evolution as a slow continuous process with natural selection operating on the small inheritable variations found between the individuals of a species which are undergoing intense competition. This neglects the important effect of the environment on the growth and structure of the individual. It is obvious that external conditions will affect the development of an organism, for example the effect of various soil conditions on the growth of a plant or the amount of food material available to an animal. Lamarck maintained that the characters acquired by an individual owing to the effect of its environment could be passed on to its offspring. Undoubtedly characters are acquired by the individual during its growth but in spite of many attempts to prove otherwise no experiments have been done which prove conclusively that these are inherited by the offspring. Thus Lamarck's theory that evolution has occurred by the inheritance of acquired characters is not generally acceptable today.

Mutation Theory—The data accumulated by Darwin showed that the variations between individuals of a species are small and graded into one another. If a particular character in a group of individuals is measured it is found that it varies symmetrically about a mean or average with most values clustered about the mean and with few extreme ones. Darwin himself was worried about this fact because although selection over a long period of time might shift the position of the mean he did not see how it could bring about the discontinuity necessary for the establishment of a distinct new species. De Vries in his *Mutation Theory* published in 1901 put forward the view that evolution depends, not on the accumulation of continuous minute variations but primarily upon large discontinuous variations or mutations. The importance of such spontaneous sports was considered by Darwin but he rejected the idea because when they appear they are usually monstrous. Such individuals are less fitted to their environment and therefore they will not survive to reproduce and give rise to a new species. That mutations are important factors in evolution is undoubtedly true but modern work has shown that the whole problem is far more complex than either Darwin or De Vries supposed.

Mendelism—It is remarkable that in spite of carrying out many careful experiments on inheritance in plants Darwin did not discover the simple

laws which are the basis of modern genetics. Mendel investigated inheritance in the garden pea and published his results in 1865, i.e. at the time that Darwin's work was being widely discussed. However Mendel's important discoveries were not generally known until 1900. When he crossed a pure breeding tall plant with a pure breeding dwarf plant all the progeny were tall. When these plants were self pollinated the next genera-

a population and are not diluted or lost. Although they may not be of importance when they first appear they may be so if the selection pressure changes and they become of survival value. Thus specific characters may change or diverge and evolution will take place. His investigations also showed that recombination of factors could give rise to plants with new characteristics. By crossing a pure bred tall plant having round seeds

tion consisted of approximately one quarter-dwarf plants and three quarters tall. From this and similar experiments Mendel deduced that the factors passed from parents to offspring were paired, only one of the pair came from each parent and that one could be dominant over the other. When he dealt with two pairs of characters, i.e. tall or dwarf plants and round or wrinkled seeds, he found that they segregated and recombined independently and in predictable ratios.

The importance of Mendel's work in relation to evolution is that it showed that there was no blending of the characters in the offspring. Mutations can be hidden as recessive characters in

with a dwarf plant having wrinkled seeds he produced in the second generation some tall plants with wrinkled seeds and dwarf plants with round seeds. When a large number of characters are involved it is obvious that considerable variation and recombination occurs upon which natural selection can work.

Mendel was fortunate in his choice of experimental material with its easily recognisable contrasting characters. It is now known that his factors are the genes carried by the chromosomes in the nucleus of the cell. At the present time the biochemical basis of heredity is being vigorously investigated. See F31.

V SCIENCES OF MAN

A biologist interested in classification might supplement the account of the animal kingdom in Part IV with the following further description of Man.

Man is a member of the order of Primates which is subdivided into two sub-orders, Prosimii and Anthropoidea. The Prosimii include the lemurs and the Tarsier; the Anthropoidea include the monkeys, the apes, and man. The anthropoid apes form a family called Pongidae and the extinct and living forms of man together constitute the family Hominidae. Although these two families constitute one superfamily the Hominoidea, there are many differences between them in both body form and function. Apes progress by over arm swinging in trees and they are usually quadrupedal on the ground, hominids habitually stand and walk upright.

But human beings have many remarkable attributes and it is not surprising therefore that besides biologists scientists of many kinds contribute to the study of man. Even anthropology which literally means the study of man is not a single well defined science but has become diversified into a number of parts which have complicated connections with biology, archaeology, sociology, history, psychology and many other studies. Physical anthropology with which we shall deal first is much concerned with the description of those physical characteristics of man which distinguish race from race and man from animals. Such a study is important if we are to learn how man evolved. To describe physical characteristics quantitatively suitable measurements must be made, i.e. we must have techniques of anthropometry (man measurement). Physical measurement of the body cannot however exhaust the study of man and therefore we shall also look at some of the current ideas of social anthropology which is one of a number of disciplines concerned

with the study of man in society. There we shall stop not of course because there are no further aspects to consider. Psychology with its many different approaches is the study of mind and something of the nature of mind and mental development will be found in Section Q.

PHYSICAL ANTHROPOLOGY

The Earliest Men and Their Dates

Fossil Primates

Some fossil forms are known both in the Eocene and the Oligocene periods (F44). However during the Miocene period in East Africa many varieties of Primates appeared, probably as a direct result of major climatic fluctuations in the area. These Miocene primates possessed attributes later to be more fully developed either among the Pongids or among the Hominids. Thus Proconsul, a common form in Miocene East Africa, was less specialised in locomotion and in cranial detail than are the apes of today. During the Miocene some of these East African primates left the trees and learned to walk upright gradually, adapting their pelvic and leg bones to an erect posture. By freeing the arms and hand thus opened the way to tool using and eventually to tool making also.

Man's Distinctive Attributes

Man has been variously defined as a large brained hominid, as a bipedal hominid and also as a maker of tools to a set and regular pattern. These criteria imply both morphological and functional attributes. In tracing man's ancestry we do not find all of these characteristics appearing simultaneously. The further back in time we proceed, the fewer of these attributes are recognisable. Bipedalism is an early feature, the other attributes were to follow later.

The Australopithecinae

These creatures probably lived during the Pliocene and Lower Pleistocene periods. For many years controversy raged as to whether they were to be classified as Pongid or as Hominid. Many dental features, for example, indicate their hominid affinities and they were moreover bipedal. However, their brains were very small and fell within the Pongid range. They might well have used tools, a widespread propensity among many Primates, but it is far less likely that the South African forms were capable of making tools in the manner described. It may well be that the use of bones, teeth and wood as tools might long have predated the use of more durable stone artifacts. On balance, however, the Australopithecinae might be described as the earliest Hominids.

Many fossil remains of the Australopithecinae have been found and they have been given a variety of names. It appears, however, that in South Africa a single genus existed probably with two species. Of these one is small, generalised and lightly built and is termed *Australopithecus* or *A. africanus*, while the other is larger, more specialised and robust and is termed *Paranthropus* or *A. robustus*. It is improbable that either of these South African forms constituted a major source of the later more advanced hominids.

In the Lower Pleistocene Bed I in the Olduvai Gorge, Tanzania, a fossil rather similar to the more rugged Australopithecines of South Africa was found, *Zinjanthropus boisei*, as it was named, is now frequently referred to as *Australopithecus boisei*. Estimated to be some 1 700 000 years old, this creature was perhaps the earliest tool maker, but it is likely that *Homo habilis*, a more advanced hominid contemporaneously existing at Olduvai, was the maker of the numerous Oldowan stone tools found in Bed I. Oldowan tools, widely distributed in Africa, represent the first tool making tradition and with this culture the Palaeolithic Age begins.

Homo erectus

Remains are very widespread in the Old World and they represent the next major stage in the evolution of the Hominids. Most finds are dated to the Middle Pleistocene period. The brain is now much larger than in the Australopithecines, though smaller than in modern man. The skull bones are very thick and the skull exhibits massive bony ridges. There is neither a chin nor a forehead present. The first finds were made in Middle Pleistocene deposits in Java by Dr. E. Dubois. This creature, *Pithecanthropus erectus* (*Homo erectus javanensis*), was indisputably erect and walked on two legs. Dr. G. H. R. von Koenigswald discovered more specimens of the same general type in Java and he also found the remains of a Lower Pleistocene more rugged form which he named *P. robustus*. A massive jaw which he found—*Meganthropus palaeojavanicus*—probably represents the Australopithecine stage in Java and has also been named *Paranthropus* (*Australopithecus*) *palaeojavanicus*.

In 1927 and 1929 the first remains of Pekin Man (*Sinanthropus pekinesis*, *Homo erectus pekinesis*) were found in Chou Kou Tien cave near Pekin. These remains were Middle Pleistocene contemporaries of Java Man whom they closely resembled.

Until certain finds were made in East Africa in the nineteen fifties and sixties, particularly at Olduvai, *Homo erectus* remains were only known from the Far East. It had been widely accepted that man originated in Asia and not in Africa, an interpretation that is little supported today. A skull found in the Middle Pleistocene Bed II at Olduvai as well as certain mandibles found at Ternifine, Algeria, are also without doubt representatives of *Homo erectus*. The Ternifine (*Athiopithecus*) jaws as well as very similar mandibles found at Sidi Abderrahman near Casablanca, Morocco, are accompanied by hand axes of the so-called Acheulean culture. The Olduvai *Homo erectus* skull dated at approximately 490 000 years was also associated with hand axes.

European fossil remains approximately contemporaneous with Pekin Man include the massive Mauer Jaw found without associated artifacts in 1907 near Heidelberg in Germany. In 1964 and

1965 equally ancient remains were found at Vertessollos, Hungary, and these are also of the *Homo erectus* type.

Absolute and Relative Dating

In tracing the emergence of man it is desirable that the various finds should be dated as accurately as possible both in relative terms and also if possible in absolute terms. Various methods have been devised and the results are often expressed by giving the date as so many years B.P. The initials B.P. stand for 'before present' and the present conventionally means the year A.D. 1950.

The potassium-argon method, depending on the rate of radioactive decay of potassium to argon, is useful for dating material from 230 000 to 26 million years old. For more recent finds up to about 50 000 years old the Carbon 14 method is appropriate. Dating with this method depends on establishing the ratio of Carbon 14 (the radioactive isotope of Carbon) to Carbon 12—ordinary Carbon. One method of relative dating is called the fluorine method, depending as it does on the fact that fossil bones contain fluorine in proportion to their antiquity. Relative dating may also be deduced from the depths at which fossil bones are found in undisturbed strata. Relative dating is also possible from the known sequence of glacial events during the Pleistocene. During this period much of northern Eurasia witnessed four major glacial advances, the so-called ice ages (Würm, Mindel, Riss and Würm), colder periods or interglacials separated the Ice Ages and geological deposits of the glacial and interglacial periods are characterised by the remains of the distinctive flora and fauna, which they contain, provide a framework for dating fossil man. Thus two human skulls from the second Mindel-Riss interglacial (130–180 000 B.P.) are known in Europe, those of Steinheim, Germany, and Swanscombe, Kent. The latter was associated with the Mid-Acheulean hand axe culture. No artifacts were found with Steinheim man. The Steinheim cranium is much more complete than the Swanscombe remains and in size it approximates to modern man. Some of its morphological features are similar to modern man, others to Neanderthal man. Steinheim could in fact be a generalised ancestor for both these major human types. The Swanscombe bones are sometimes similarly interpreted though they have on occasion been classed as an early form of *Homo sapiens* pre-dating the Neanderthals.

Neanderthal man

Neanderthals are found in Upper Pleistocene times during the early part of the Würm glaciation, particularly in Europe, West and Central Asia and North Africa. Early discoveries included those in the Neander valley in Germany, Gibraltar, Spy (Belgium) and Krapina (Yugoslavia). Subsequently many other finds were made including, for example, La Chapelle (France), Teshik-Tash (Uzbekistan), Hauma Fteah (Cyrenaica) and Rabat (Morocco).

Early proto-Neanderthals such as Steinheim were followed by the classic Neanderthal forms, conventionalised as of brutish appearance with massive eyebrow ridges, sloping foreheads, long large crania and receding chins. The cave of Tabun on Mt. Carmel, Israel, yielded remains of these classic forms while the nearby Skhul cave contained remains of men much more similar to those of today. The remains may represent variation normal within a group or else may indicate that the Neanderthals interbred with people of modern type, thus producing the Skhul hybrids.

Rhodesian Man found in 1921 in Broken Hill, Zambia, is clearly neither a Neanderthal nor a modern type of man. The skull was for long thought to be unique, if not highly aberrant. However, in 1951 a similar skull was found at Saldanha Bay in the Cape Province of South Africa. These are early Upper Pleistocene remains, approximately 40 000 years B.P. Solo Man in Java is a not altogether dissimilar and may be the direct descendant of *Homo erectus* in South East Asia. Both Rhodesian and Solo Man are sometimes regarded as variants of the basic Neanderthal type.

Homo Sapiens

Homo sapiens emerged during the fourth Würm glaciation a process precisely dated by the radiocarbon technique among others. Neanderthal Man seems to have been replaced by *Homo sapiens* of completely modern appearance only by some 30 000 years B.P.

Neanderthal Man's stone tools were made on flake and in Europe constituted the so called Mousterian industry. Post-Neanderthal men were technically more advanced: their stone tools including small knife blades and engraving tools specialised for different purposes. This is the typical Upper Palaeolithic tool assemblage of the Aurignacian, Solutrean and Magdalenian and other tool making cultures. It was during this Upper Palaeolithic period that man though still everywhere a hunter and gatherer of food-stuffs first showed artistic tendencies.

Combe Capelle in southern Central France yielded the earliest known skull (approximately 34 000 years B.P.) of completely modern type in western Eurasia and Africa. The Cromagnon people were somewhat later (20-30 000 years B.P.). Physically the Cromagnon people were tall with long heads, very large brain cases and short broad faces. Approximately similar humans have been found elsewhere: at the Upper Cave at Chou Kou Tien and a skull from the Niu Cave in Sarawak dated at about 40 000 years B.P. is the earliest known representative of *Homo sapiens* in Asia. In Java the descendants of Solo Man will be the Wadjak people of about 10 000 years B.P. These are similar to the Australian Aborigines and they may be roughly contemporary with a skull from Kellor near Melbourne which indicates that Australia was populated in late Pleistocene or early post-Pleistocene times. Again in Upper Pleistocene Southern Africa there were people with very large brain cases and with features rather like the present day Bushmen and Hottentots. The Boskop skull is of this type. No skeletons showing characteristic Negro features have been found in Africa before post-Pleistocene times. This suggests a late evolutionary emergence for the Negroes. The Americas were peopled by immigrants from North East Asia some 15-20 000 years ago and subsequently. Some of the early groups of immigrants have been described as Archaic White, as have the Ainu of Northern Japan but it is more generally accepted that successive waves of Mongoloids moved into the Americas from Asia, the Eskimo being the last group to arrive.

Even today the total number of known fossil human remains is small for the long time span of human evolution and it is very difficult if not impossible as yet to trace the precise ancestry of each of the races of man.

The Races of Man

The species *Homo sapiens* to which all living men belong is differentiated into local variant populations which are interfertile and not always sharply distinguished from one another. Many attempts have been made to classify mankind into races usually on the basis of readily visible external features such as head shape, stature and skin colour. Such formal classifications express real features of human variation but in somewhat artificial if not misleading manner since the impression is created that the species is naturally partitioned into discrete discontinuous groups whereas changes from one region to another are often gradual rather than abrupt transitions. Again all human groups are variable within themselves and populations frequently overlap considerably in quantitative characters in which case the distinction between them is best expressed in statistical terms as differences in average values. Discrete variables such as blood groups are usually found in most populations but with different frequencies of occurrence.

A race is best considered as a Mendelian population that is as a reproductive community of individuals who share in a common gene pool. Again a race has been defined as a group of people who have the majority of their physical attributes in common. It is manifestly improper to refer to religious or linguistic groupings as races since cultural attributes obviously vary quite indepen-

dently of the physical features used in race definition.

Three types of Mendelian populations or races are sometimes distinguished: (1) Geographical, (2) Local and (3) Microgeographical or Micro races.

(1) Geographical Race

This is a collection of Mendelian populations such as occupy whole continents or large lands and separated by major barriers such as mountains and deserts. The Australian Aborigines and the African Negroes provide examples.

(2) Local Races

These are sub-populations within the Geographical Race, frequently corresponding with distinct or isolated breeding populations. They are adapted to local environmental pressures and are maintained by social and physical barriers which prevent gene flow between them. Examples include the tribes within the Amazonian Geographical Race, the Basques, Annu and Gypsies.

(3) Micro races

These are the numerous distinct populations which are not clearly bounded breeding populations and can be distinguished only statistically. Their existence is demonstrated by variations in the frequencies of genes within a densely populated country. Many of man's physical attributes do vary from group to group and since these traits have a genetic component then they also are characteristic of micro races.

Anthropometry

This constitutes a system of techniques for the measurement of the skeleton and of the body from the early 19th century onwards. Anthropometry was an important means of giving quantitative expression to the variation in physical traits among human beings. In fact until fairly recently anthropometry has been the mainstay of physical anthropology preoccupied as it was with the problems of evolutionary descent. The measurement of the skeleton was stressed since skeletal remains constitute the most direct evidence of earlier populations. The shape of the living body and of the skeleton can precisely be expressed metrically but it is usual to use relatively few measurements and these normally represent the major features including for example stature, shoulder width, head length and head breadth. The latter two were especially favoured and the cephalic index was obtained by expressing the breadth as a percentage of the length. Long heads with low cephalic indices (below 75) were termed dolichocephalic while round heads with high indices (above 81) were termed brachycephalic.

Anthropometric features are known to vary widely among the world's populations. Thus while the Nilotics of the Sudan have an average stature of 1.73 m, the African pygmies average 1.36 m. Dolichocephalic heads are prevalent among Australian Aborigines while brachycephaly is extremely prevalent among the Mongoloid peoples of Asia.

Anthropometric characteristics such as these are not immutable and it has been shown in studies in the United States, Hawaii and elsewhere that immigrants offspring rapidly develop bodily changes when compared with their parents or when compared with groups in their homelands. It is impossible to say whether the races of man are becoming more or less heterogeneous as a result of such processes.

Pigmentation

Hair skin and eye colour were traditionally described either in subjective terms or else by reference to matching standards. Both procedures presented serious limitations in reliability and in comparability of results. Recent years have witnessed the use of much more satisfactory objective procedures, involving spectrophotometers in hair and skin colour studies. These instruments record the percentage of light of a

number of known specified wavelengths reflected from a surface relative to the reflectance from a pure white surface. In general the darker the specimen, say of hair, the lower the percentage of light which it reflects. Using such instruments precise and reliable quantitative estimations of hair and skin colour are possible. The genetic basis of the traits may be clarified and comprehended and the selective advantages of skin and hair colour may be examined quantitatively. Dark skins confer advantages in hot sunny areas since they protect the body against the harmful effects of ultraviolet radiation minimising the incidence of skin cancer for example. Light skins are advantageous in cloudy areas with low insolation since they facilitate the body's synthesis of Vitamin D thus reducing the incidence of rickets. The correlation between dark pigmentation and high levels of solar radiation is high but it is impossible to state how much of the geographical distribution of skin colour mirrors the spread of dark and light skinned peoples from one or two sources and how much of the patterning is due to independent adaptations in many human groups in the past.

Physiometric Observations

These cover a range of phenomena including handedness, the ability to taste phenylthiocarbamide (P.T.C.) colour blindness and fingerprints. The genetic basis for many of these attributes are well known. Thus red green colour blindness is a sex linked character males being far more frequently affected than females. Within Britain percentages of colour blind males range from 5.4 in N.E. Scotland to 9.5 in S.W. England. Non-European populations generally exhibit much lower frequencies.

The tasting of P.T.C. is controlled by two genes T and t the former being dominant. TT and Tt individuals normally experience a bitter taste sensation when they sip P.T.C. solutions tt individuals either cannot taste the substance at all or else only in very strong concentrations. The tt individuals are termed Non tasters. TT and Tt individuals are termed Tasters. High frequencies of Non tasters (exceeding 88 per cent) occur in parts of Wales and in Orkney while low values (approximately 24 per cent) occur in North Lancashire and Northumberland. A clue to the selective significance of this trait is provided by the excess of Non tasters among individuals with nodular goitres (thyroid abnormalities). Non-European populations usually have lower percentages of Non tasters than the British figures quoted.

Attributes of the Blood

1 Blood Groups

Many blood group systems (see Index to Section P) are known today in addition to the ABO system which was the first discovered and which matters so much in blood transfusion. The mode of inheritance of the numerous blood group substances is known. Blood grouping is relatively simple depending as it does on reactions between antigens on the red blood cells and specified antibodies derived from the blood serum.

The ABO system basically involves three genes A, B and O. Every individual inherits two of these genes from parents and so the genotype (genetic constitution) must be one of the following: AA, AO, BB, BO, AB or OO. O is recessive to both A and B and thus there are four possible phenotypes (genetic constitutions detectable by blood grouping): A, B, AB and O.

The ABO genes constitute a polymorphic system that is several genes occur with frequencies such that the least frequent of them occurs with a frequency exceeding that due to mutation alone. Certain selective advantages and disadvantages of the ABO genes in human populations are known. Thus stomach cancers are more frequent among individuals of group A than they are in the population at large. Again duodenal ulcers are almost 40 per cent more common among persons of blood group O than in individuals of the other ABO groups.

Both on a global and on a local scale the ABO genes display marked racial variation. Within Britain A varies from 81 per cent to 58 per cent

increasing in frequency from North to South. O varies from 38-54 per cent increasing in frequency from South to North. B shows less variation though it is most prevalent in the Celtic areas. The regional fluctuations are not random but systematic and statistically highly significant despite the enormous migrations within Britain during the last few hundred years which might well have masked or minimised the underlying variability.

Globally the ABO variation is also striking. Thus the percentage of the blood group B exceeds 30 among the Mongoloids of Central and East Asia but the B gene is virtually absent in the Australian Aborigines, the American Indians and in the Basques. Many American tribes are 100 per cent O, some others have very high A frequencies.

In the Rhesus blood group system all humans are either Rh+ (DD or Dd) or Rh- (dd) (see Index to Section P). All the Amerindians and Australian Aborigines and most of the East Asians are Rh+. Rh- individuals are more frequent in western Asia, in parts of Africa and especially in north west Europe where the Rh- percentage is approximately 15. The Basques are distinctive in having a 40 per cent Rh- frequency. Racial variation is partly explained by selection via haemolytic disease of the newborn (*erythroblastosis foetalis*) whereby Rh+ offspring of Rh- women (possible if the father is Rh+) may die before birth owing to their Rh blood group incompatibility with their mother.

2 Haemoglobins

Haemoglobin exists in alternative forms in man and these are genetically controlled. The frequencies of some of the genes which control haemoglobins vary markedly among human populations. The principal technique used to show variant haemoglobins is electrophoresis—the movement of charged particles in an electric field.

Normal human haemoglobin comprises two different haemoglobins (A and A2). An interesting variant is haemoglobin S. This may be indicated by electrophoresis and also by a sickling test. Red cells containing haemoglobin S placed in an oxygen free atmosphere assume sickle shapes. Individuals who have inherited one S gene (AS heterozygotes) have a mild non fatal anaemia—the sickle cell trait. Homozygous SS individuals suffer from the severe sickle cell anaemia which is usually fatal before maturity. Some abnormal haemoglobins including S, E and C have high frequencies and their existence since all of them are deleterious to some extent provides opportunities for viewing the action of natural selection and gene flow in human populations. Haemoglobin S reaches very high frequencies among some populations in southern Asia and particularly in much of tropical Africa (10-40 per cent) despite its severe effect on individual viability and fertility. Haemoglobin C is most prevalent in northern Ghana and contiguous areas while Haemoglobin E is found principally in South East Asia with frequencies as high as 27 per cent in Cambodia.

Homozygous SS individuals hardly ever live to transmit the S gene and without a compensatory effect the gene would be totally lost except for certain cases possibly occurring as mutations. Compensation is through positive selection in favour of AS individuals who are more resistant to and so protected from falciparum malaria. Again AS females might be more fertile than AA females in certain populations and thus again would help to maintain the high S frequencies.

Other polymorphisms include the haaptoglobins (proteins that bind the haemoglobin of old and broken down red blood cells), serum transferrins (proteins in the blood sera used in transporting iron within the body) and the enzyme Glucose 6 phosphate Dehydrogenase (G6PD) and selective agencies are operative on these also.

The non uniform distribution of blood group haemoglobin and other gene frequencies in the races of man may be explained in terms of natural selection, gene flow between populations, random genetic drift, the founder principle and the development of geographical and socio-cultural isolation.

As a principal agency only natural selection can account for the magnitude of the population differences and for the maintenance of the

observed balanced genetic polymorphisms in man. Known frequency distributions suggest that there is some relationship between the environment and the incidence of, for example, the blood group genes. Both the variability and also the geographical gradients for the A and B genes are consistent with the hypothesis that these genes are influenced by environmental selection and it seems unlikely that such a phenomenal relationship is confined to the ABO system. Human populations or races are defined in terms of traits only some of which have here been indicated which are brought into being and maintained primarily by natural selection—by the incidence of disease blood group incompatibilities, diseases of the new born and by differential fertility.

THE STUDY OF SOCIAL ANTHROPOLOGY

What the Subject is About

Social anthropology is concerned with the way men live as members of ordered societies. It has been described as a branch of sociology or as the sociology of the simpler peoples. Neither description is wholly correct. A social anthropologist seeks to identify the *structure* of the society he studies and the *processes* of social interaction within it. His method is direct contact—what has been called participant observation. Therefore he must deal with a unit small enough to be manageable with this technique. Nation states such as sociologists commonly work among are too large. Most social anthropologists have done their work in what we call small scale societies that is peoples who lacked such media of communication as writing or money, let alone mechanical means of transport until these were brought to them from Europe. A social anthropologist may choose to work in some section of a society that possesses these techniques—in the ancient countries of the East or in Europe or America. In that case he confines himself to a microcosm such as a village or a factory. When he is writing of societies alien to his own and that of most of his readers he is obliged to describe their culture as well as their social relationships since without such a description his readers would not be able to picture or even understand the social rules that are his main subject of study. This would be superfluous for a sociologist taking modern machine society for granted. Culture has been called the raw material out of which the anthropologist makes his analysis of social structure. It is the sum total of standardised ways of behaving of lore and technique of belief and symbolism characteristic of any given society.

The Notion of Roles.

All the world, as Shakespeare said is a stage and this is a key metaphor for social anthropologists. Every individual does indeed play many parts not consecutively but all together for every social relationship carries with it the expectation of society that the parties to it will behave in approved ways. Father and children, ruler and subjects buyers and sellers husband and wife every one of these words is the name of a role to be played by the person it describes. The playing of roles involves the recognition of claims and obligations as well as appropriate modes of behaviour in personal contacts. All these rules are called *norms* when they are concerned with rights and obligations they are *moral norms*. A social norm is what people think ought to happen unlike a statistical norm it may or may not be what happens in the majority of cases.

Kinship and Marriage

In societies of simple technology most roles are ascribed that is the parts people will play in life are given them at birth by the fact of their parentage and of the group in which this makes them members. In other words the most important principle of organisation is *kinship*. W. H. R. Rivers called this the social recognition of biological ties. The ties in question can be called genealogical they all derive from the recognition of common ancestry. Such ties may be fictitious as when a child is adopted. But in the vast majority of cases the relationships that are recognised are actually biological.

No man can recognise for social purposes all the individuals with whom he has a common ancestor somewhere in the past or even know of their existence. Their number increases with every generation. In every society a selection is made from the whole universe of genealogically related persons of certain categories towards which an individual recognises specific obligations and on whom he can make specific claims. Such *corporate groups* of kin have a permanent existence they recruit new members in each generation in accordance with recognised rules. Kin groups are concerned largely with the transmission of property and for this and other purposes they recognise the common authority of a senior man. They are also religious groups performing together rituals directed to their common ancestors.

The common patrimony of a kin group normally consists in land or livestock. In societies of more advanced technology it may be a boat as in Hong Kong or even as in Japan a family business. It may have no material resources too such as the right to supply chiefs or priests to the society as a whole. This may be put conversely as the right to hold political or religious office. Those who share a common patrimony have a common interest in preserving and increasing it. Wrongs done by their members to outsiders are compensated from their collective resources and they have joint responsibility for seeking compensation if one of their own members is injured particularly in the case of homicide.

Descent

Kin groups may be recruited according to a number of principles. A principle widely followed in small scale societies is that of *unilineal descent* that is group membership is derived from one parent only either the father (*patrilineal* or *agnatic*) or the mother (*matrilineal*). Property is administered by men in either system but in the matrilineal system it is inherited from the mother hence its control passes from a man to the sons of his sisters. In a unilineal system every individual recognises kin linked to him through the parent from whom he does not trace his descent this is the principle of *complementary filiation*. The complementary kin are *matrilateral* where the descent rule is patrilineal *patrilateral* where it is matrilineal. A unilineal descent group is called a *lineage*.

Descent can also be traced *cognatically* that is all descendants of a common ancestral pair may be recognised as forming one *kindred*. In such a system there is no permanent group patrimony people inherit a share of the property of both their parents and this is often conferred upon them when they marry while their parents are still living. Or all the inhabitants of a village may share rights in its rice fields or fishing ponds a man chooses among what kin he will live but he can have rights in one village only. In such a system there are no continuing groups defined by descent the permanent group is territorial consisting in the inhabitants of the village.

Marriage

Kinship status is defined by legitimate birth and this in its turn by legal marriage. There are always rules against marriage with specified categories of kin, though these are not necessarily near kin. Some societies consider that the ideal marriage is that between the children of a brother and a sister if such marriages are repeated through the generations they create a permanent link between two lineages. Marriage between members of the same lineage is nearly always forbidden this is expressed in the term *lineage exogamy*. The general effect of the prohibitions is to spread widely through a society the links created by marriage links that impose an obligation of friendship on groups that without them would be mutually hostile.

In a matrilineal system women bear children for their own lineage it is expected that they should be fathered by a man who has married their mother according to the approved procedure but a child's lineage membership is not affected by the marriage of its mother. But in a patrilineal society wives must be brought from outside to bear children for the group. Associated with this fact is the payment of *bridewealth* which used to be mistakenly interpreted as the purchase of wives.

This payment is what fixes the status of a woman's children. All those she bears while the bridewealth is with her lineage are reckoned as the children of the man on whose behalf it was paid, even if he is dead and she is living with another partner. In a matrilineal society the making of gifts is part of the marriage procedure but they are of slight economic value in comparison with bridewealth. The difference is correlated with the difference in what the husband acquires by the marriage. In both cases he gains the right to his wife's domestic services and sexual fidelity but where bridewealth is paid he can also count her children as his descendants and call on their labour when he needs it.

In societies where most roles are ascribed by the fact of birth marriage is the most important field in which there is freedom of choice. But the choice is commonly exercised not by the couple but by their lineage seniors who are more concerned with alliances between lineages than with the personal feelings of the pair. *Polygamy* or the simultaneous marriage of a man to more than one woman is permitted in lineage based societies. Indeed it is the ideal though only a minority of men attain it. One reason why it is valued is that it enables a man who has the resources necessary for successive bridewealth payments to build up a network of alliances.

Authority Systems

Every society has some arrangements for the maintenance of order in the sense that force may be used against those who infringe legitimate rights. In every society theft, adultery and homicide are treated as offences. Where no individual has authority to punish these on behalf of the community, *self help* is the approved course. Lineage membership is significant here: a man who is wronged will go with his kin to seek redress (for a theft or adultery) or vengeance (for the homicide of a kinsman). Vengeance can be bought off by the payment of compensation but because the taking of life is a serious matter in the most turbulent of societies there must also be a solemn reconciliation with a sacrifice to the ancestral spirits between the lineages of killer and victim. The recognition of an appropriate method of dealing with injuries has been described as 'the rule of law' in its simplest form.

Within a lineage the senior man is expected to settle quarrels and the ancestral spirits are believed to punish with sickness juniors who do not listen to him. When quarrels break out between members of different lineages their elders may meet and seek a solution. Where there is no hereditary authority individuals may attain positions of leadership in virtue of their powers of mediation by persuasion.

In addition to the maintenance of rights most societies require at some time arrangements for the organisation of collective activities. It is possible for there to be no ascribed role of organizer in such a case leadership is a matter of competition. Competitive leadership in economic activities is characteristic particularly of the very small societies of New Guinea. What is needed here is not only powers of persuasion but resources to reward the participants. The very important principle to be discussed later that every gift ought at some time to be returned is the basis of their position. A man who can put others in his debt can call upon their labour. It may take a long time to build up the necessary resources for acknowledged leadership and leadership may be lost to a rival and is not necessarily passed to an heir.

Responsibility both for law and order and for collective activities may be shared on recognised principles among the whole adult male population. This is done where society is organised on the basis of age, a system widely found in east and west Africa. In such a system all adult men pass through a series of stages at each of which appropriate tasks are allotted to them. In its simplest form the division is made into warriors and elders. This principle may be complicated in various ways but the essence of it is that men in their prime are responsible for activities requiring physical strength, impetuosity and courage while their elders have the task of mediating in disputes, discussing public affairs and performing sacrifices to the ancestors. Men in the warrior

grade are the fighting force and may also have the police functions of summoning, disputants and witnesses before the elders and seizing property from a man who has been adjudged to pay compensation and does not do so voluntarily. Some times specific public works are allotted to them such as rounding up stray cattle or clearing weeds from paths or springs. It is also possible for community responsibilities to be shared in more complicated ways for example among the Yoruba of Nigeria where the adherents of particular religious cults are believed to call on the spirit which they worship to punish persons guilty of particular offences.

Where there are hereditary chiefs, both public works and the maintenance of law and order are the responsibility of the chief and his subordinate officials. Resources are accumulated for public purposes by the collection of tribute and labour is obtained for public works by the recognition of the principle that persons in authority can claim the labour of those subject to them. Expectations are attached to the role of chief as to any other. Chiefs are expected to dispense justice fairly to be generous to the poor, to reward loyalty and to be successful in war and they are rewarded of these expectations in the course of the elaborate rituals performed at their accession. The prosperity of the whole land is commonly held to be bound up with the health of the chief and the favourable attitude towards him of supernatural beings. He may be obliged to obey all kinds of ritual restrictions to this end: for example it was believed of the ruler of Ruanda in east Africa that he must not bend his knee lest the country be conquered. Chiefs are either themselves responsible for the performance of ritual on behalf of the whole populace or must maintain priests to do this.

Social anthropologists have recently turned their attention to the process of competition for the commanding roles which any society offers. Some would claim to have discarded the idea of structure altogether in favour of that of process, yet the structure must be taken into account as the set of rules in accordance with which the game is played. There are societies where it is the rule that on the death of a chief his sons must fight for the succession to test who is the strongest and has the largest following. There are others where the rule of succession may seem to be clear and yet there can always be dispute as to who fits it best. Sometimes people pursue the struggle for power by accusing their rivals of witchcraft, sometimes by massing their followers behind them in a show of strength before which their adversaries retire. The first is the method of the Ndembu in western Zambia, the second that of the Pathans in the Swat Valley in Pakistan. Such confrontations occur at moments of crisis but the process of building up support is going on all the time. The study of these processes is among the most interesting new developments in social anthropology.

Economic Systems

In societies where money provides a common standard for measuring the relative value of different kinds of goods, people who exchange goods can make very exact calculations of profit and loss. It is often assumed that where there is no such common medium of exchange people do not make any economic calculations and dispose of their property in ways that are the reverse of businesslike. The principal reason why this assumption is made is the great importance attached in societies of simple technology to the making of gifts. The essential difference between a gift and a commercial exchange is that no return is stipulated. In the commercial world goods are sold, services hired at a price and anyone who fails to pay has broken a contract and is liable to be punished. The obligation to return a gift is a moral one. Moreover to compete in the giving of gifts seems at first sight the very opposite of competition in the acquisition of wealth. But in most societies people who have a surplus of wealth like to have a reputation for generosity: only in the affluent world of machine production people feel the need to have many more material possessions before they begin to think in terms of surplus.

The exchange of gifts plays a particularly large part in the societies of Melanesia where men

form partnerships for the express purpose of giving and receiving valuable objects and earn prestige at least as much by giving as by receiving. This exchange of valuables, mostly shell ornaments, is so important that it has a name in the language of each society. The first such exchange system to be described by an anthropologist was the *kula* of the Trobriand Islands observed by Malinowski. An important man had a partner in an island on either side of his own home, from one he received armbands and returned necklaces from the other he received necklaces and returned armbands. These objects did not become part of a store of wealth for any man, nobody could hold one long before it was time to pass it on to his partner. To receive his gift a man sailed by canoe to his partner's home, he was there welcomed peacefully and while he was making his formal visit the crew were bartering their goods on the shore with the local populace. Thus the *kula* partnership had the nature of a political alliance. It was a means of maintaining peaceful relations between populations which would otherwise have been hostile.

In the highland areas of New Guinea identical objects are exchanged, but the relative value of amounts given and received can be calculated. In some parts the ideal is that a return gift should be twice the original one. Naturally it is no small achievement to carry on a prolonged series of exchanges at such a rate. Very few men manage it, and those who do are the acknowledged leaders of their community. For each large gift he has made a man wears a little bamboo stick hung round his neck, thus his munificence is publicly proclaimed. A new partnership is initiated by making the minimum gift. Men make these partnerships with others not bound to them by kinship, notably with their relatives by marriage. Each partnership extends the range within which a man can count on friendly treatment. So widespread is the idea that gifts should be repaid and services rewarded after some delay and at the discretion of the man making the return that where the highland people have taken to growing coffee for sale the large scale planters do not pay wages but employ young men for planting who get their return by coming to them later for help in difficulties. Of course the young men would stop giving their work if they judged that the return was not adequate.

Gift giving then is an investment but not one that produces a direct material return. One anthropologist R. F. Salisbury has called it an investment in power. The extreme case of such an uneconomic use of goods was found—before it was forbidden—in the *potlach* of some Indians of the north west coast of America. There a man who was insulted would challenge the offender to a competition in destruction. Great quantities of fish oil would be poured on the fire and sheets of copper thrown into the sea. The challenger was demonstrating how much wealth he could afford to destroy.

Certainly this is not turning resources to material advantage. No more is the giving of a very expensive dinner party in London or New York. But equally certainly it is not done without calculation. In the affluent society people display their superior affluence because this demonstrates their prestige rating just as in the *potlach* and they keep on good terms through the hospitality they offer with people from whom they may later seek a return in professional dealings rather than in the Melanesian gift-exchanges. The difference between the uses to which resources are put in societies of simple and of complex technology is one only of degree. The proportion that is devoted to securing non material advantages is higher in the small scale societies and so is the proportion of gift giving to commercial exchange. In gift giving there is no bargaining but there is a clear expectation of return. The initiation of new social relationships by the making of gifts is not by any means confined to New Guinea. Bride wealth which legitimises children is the most widespread example. Pastoral people in East Africa also make gifts of stock to selected friends in distant parts. The friend on his home ground is a sponsor for his partner and he is expected to make return gifts from time to time and may be asked for a beast if his partner is in difficulties. One could think of such an arrangement as a type of insurance.

A small number of social anthropologists have specialised in the study of the economic systems of small scale societies and have asked whether the concepts devised for the analysis of monetary economies—such notions for example as capital and credit—can be applied to people who gain their livelihood directly from the resources of their immediate environment. Starting from the assumption that there is always some choice in the allocation of resources they have observed how these choices are actually made in the societies where they have worked. They have asked how the value of such goods as are obtained by harder is measured, how labour is obtained, how directed and how rewarded for such enterprises as the building of a canoe or a temple which call for the co operation of large numbers. They have examined the use of media of exchange asking, how far any of these fulfil the functions that we associate with money.

The general conclusion of these studies is that peoples of simple technology are perfectly capable of rational calculation in the allocation of their resources even though their calculations are rough or compared with those of the state entrepreneur in an industrial society. They know what to regard as an adequate return when they are bartering goods. They withhold goods from consumption when they are planning an enterprise, that is to say a man who proposes to initiate such an activity as canoe building arranges to be able to feed his labour force.

Religion

At a time when people questioned whether primitive societies could be said to have religion, E. B. Tylor offered as a minimum definition of religion, the belief in spiritual beings. All societies of simple technology have such beliefs and think that unseen personalised beings influence the course of nature by direct intervention causing rain to fall if they are pleased with the actions of men and withholding it if they are angry, sending sickness as a punishment and so forth. In the great majority of such societies the most important spirits to be worshipped are those of dead ancestors. But there may also be a belief in gods responsible for particular aspects of the world to whom offerings are made for protection or success in their special fields. Many preliterate peoples believe in a high god from whom all other spirits derive their power and one school of anthropology sees this as evidence of an original state of higher religious consciousness from which man has declined, but this view is not widely held.

Rituals involving groups of people are commonly performed on occasions when changes of status are to be signalled. A child becomes a member of society not by being born but at a naming or showing ceremony. A youth or girl becomes adult at initiation. Marriage which makes a couple into potential parents and links their kin groups is another such ritual.

In funerary rites the dead person is made into an ancestor and his heir adopts his social personality and his responsibilities. The accession of a man to political office is surrounded by ritual and chiefs frequently observe annual rites at the time of harvest when it is the season not the person that is changing. These are *confirmatory* rituals designed to keep society and the world on an even course. When something goes wrong, a drought or epidemic or an individual sickness, greater rituals are performed to make peace with the spirits responsible for the disaster.

An essential aspect of many of these religions is the belief in witchcraft—that is that it is possible for humans to harm one another merely by hating them. Witchcraft supplies an explanation of undeserved misfortune. Diviners employ a multitude of techniques (which anthropologists rather inaccurately call oracles) to detect whether a disaster is a merited punishment or is due to witchcraft.

Every small scale society has its myths—stories which tell how the world as people know it came to be. Sometimes their ritual re-enacts the myth, often the myth tells how the ritual was first performed and thereby gives a reason for its continuance. Then there are myths telling how death and evil came into the world. Some myths

lend authority to the existing social order and particularly to the claims of ruling groups by telling how the social structure was divinely ordained. Under the influence of the French anthropologist Lévi-Strauss many anthropologists are beginning to see both myths and the symbolism of ritual as man's earliest attempt to order intellectually the world of his experience.

Social Change

No doubt all the societies that anthropologists have studied have been gradually changing throughout the centuries when their history was not recorded. But they experienced nothing like the rapidity of the changes that came to them when they were brought under the rule of European nations and introduced to mass production and a money economy. The effect of this has been in essence to widen the range of choice in the rela-

tionships that people can form. A man may choose to be dependent on an employer rather than on work in co-operation with his kin or village mates. He is more likely to rise in the world by going to school and getting a city job than by earning the respect of the villagers or the approval of a chief. Small-scale societies are now becoming merged in larger ones and the close ties of the isolated village are loosened. In the newly created industrial areas new specialised associations are formed to pursue professional and other interests. The social insurance that kinship provided is fading and it has not as yet been replaced by what the state offers in the highly industrialised societies. The minority that has wholeheartedly adopted the values of the industrialised world now produces the political rulers of new states. They are impatient to carry the majority along the same road but there are profound conflicts of value between them and the still largely illiterate masses.

PART VI SPECIAL TOPICS

SCIENTIFIC FINDINGS FROM THE APOLLO 11 LUNAR MISSION

The moon has been an object of scientific study ever since Galileo turned his new telescope on to it in 1609. However, 300 years later a new era began when on 18 July 1969 two members of the crew of the U.S. Apollo 11 mission stepped down on to the surface of the moon. There they made numerous novel observations, deployed certain notable experimental arrangements and a few days later safely brought back to their base some 11 kg (24 lb) of lunar rocks and a similar quantity of lunar soil. Before the mission began there had been anxiety that lunar rocks and soil might conceivably carry organisms and spores which could be deadly to earth inhabitants. This was really only a remote possibility for there is no atmosphere on the moon; no water was expected; temperatures at the height of the lunar day could be 130°C and at the middle of the lunar night could well drop much lower even than -150° below zero and added to that the intense radiations from the sun (not thinned out at all by any atmosphere as on earth) would act as a fierce sterilising agent on any organisms. However, purely as a precaution both the crew and the materials retrieved were strictly quarantined for 50 days and subjected to exhaustive biological testing. Plants, animals and so on were all infected with moon dust. It turned out to be completely sterile.

This being so, a total of 7 kg of the retrieved material was distributed in selected small quantities to 150 scientific laboratories for a meticulously planned examination, planned with the efficiency of a complex military operation. Most of the laboratories chosen for their expertise and for their specialised equipment were in the U.S.A. some fourteen in Great Britain and a small handful in various other countries. Since in most of the laboratories selected examination of the material was carried out by a multiple team, it will be seen that several hundred specialists—mainly geologists, mineralogists, chemists and physicists (together with a strong force of technicians) pooled their skills into a well co-ordinated and concentrated attack on this precious unique cargo which had been brought back at such enormous expense from the south-western part of a region on the moon known as Mare Tranquillitatis, the location being 6° 67' N and 23° 40' E, that is to say from practically a lunar equatorial region.

Before the Apollo mission the U.S. space team had successfully soft-landed spacecraft on the moon—the Surveyor craft. These had sent back some very excellent television pictures of the moon's surface which had indicated that the terrain was barren, pitted and very forboding. Furthermore, they had shown that where they landed the surface was covered with a firm soil capable of supporting some considerable weight. It was such information which encouraged the

N.A.S.A. organisation to go ahead with a landing and in the event this televised information proved to be absolutely reliable. Despite some expressed fears that a landing craft might sink in concentrated lunar dust, this did not happen for the manned craft on arriving found a firm landing on soil covered rock. As is now widely known, the astronauts spent several hours on the moon since they were expertly furnished with a fine life-supporting system. Communications were perfect between them (it had to be radio communication of course for there is complete silence on the airless moon) and indeed superb television pictures were sent back during the famous moon walk. A major objective was the retrieval of lunar material for study.

Three kinds of material were brought back, namely (i) rocks, (ii) fine surface soil scooped up into bags and (iii) two cylindrical cores of soil obtained by hammering hollow tubes in to a depth of some 6 inches, the idea being to secure some evidence of stratified layers if any. Much preparatory work and training went into the design of the collecting tools and the storage packages. In particular, contamination problems were studied and in the end tools of stainless steel and plastic packings were found best. Since there is no atmosphere on the moon all the objects were effectively picked up in a first class vacuum. They were therefore sealed in vacuum tight containers which on return to earth were opened in a vacuum chamber. This was essential for those observations concerned with evaluation of slight gas content in the lunar material.

Considering the relatively trivial quantity of rock and soil recovered, an astonishing number of basic scientific findings have already been made. In a conference on progress held in Houston in early January 1970 preliminary findings were announced. The expanded reports from this conference fill 3 massive volumes, a total of some 2,500 closely packed pages of measurements made over an extensive variety of geological, chemical and physical properties. In this article we pick out some of the highlights from this report.

Apparatus on the Moon

The lunar mission was valuable for reasons other than the retrieval of the precious lunar material. The astronauts made very many notable visual observations which they recorded and brought back a mass of close-up photographs (in colour) showing rocks, etc. *in situ*, before collection information of very pertinent significance to the practical geologist. (Strictly speaking one ought to talk of a selenologist, not of a geologist.) They noted physical properties of lunar soil brought back comments on varieties

of craters conducted a brilliant original television transmission seen by the whole world and successfully deployed three prepared experiments. The first was to set up a seismograph a recorder of lunar quakes—an equipment designed to tele-meter back to earth moon quakes and trembles if any. This functioned for three weeks and indeed sent back numerous strange signals. It is not clear yet whether these were due to meteor impacts or indeed to gurgling venting of residual fluids from the spacecraft left in the vicinity. The second experiment consisted in setting up a large light reflector. Later this functioned in a remarkably successful way. From the base on earth an extremely intense short pulse of light (from a special light source called a laser) was sent to this reflector and the time taken for the light beam to reach it and get back was measured with the greatest precision. The time is only 2.5 seconds but it can be measured to within a thousand millionth of a second by modern devices. Since the speed of light is accurately known this timing permits of an assessment of the distance to the moon with very high accuracy indeed. In fact with the first set of measurements already reported the moon distance has been measured to within an error of only four metres! This astonishing performance opens up a new era in observing the orbit and wobbles of the moon. In future it is expected that scientists will be able to improve on this precision and measure the distance between the reflecting station and the reflector to within a mere 6 inches!

The third experiment set up by the astronauts was intended (and succeeded) to measure the constituent atoms in the solar wind. It has for some time been recognised that the enormous high temperature activity of the sun leads to the hurling out from the sun of a vast wind of energetic atoms of various kinds. On earth these are trapped in the upper atmosphere. The moon has no atmosphere hence the solar wind atoms arrive on the surface indeed they bombard it violently. Actually this was at one time considered a possible dangerous hazard for lunar astronauts but since they were well protected it proved innocuous. Something of the nature of the solar wind has been assessed by the experiment set up by the Apollo team. A sheet of aluminium foil of area 4 square yards was exposed on the moon to the sun's rays for one and a quarter hours. It received in addition to light the atoms from the solar wind which were caught and trapped in the aluminium. The foil was rolled up and brought back. When heated in a vacuum in the laboratory it released gas which had been trapped and by using highly refined testing methods solar wind particles could be identified. In particular atoms of helium, neon and argon were found as constituents in the solar wind. This fact has had a considerable part to play in other observations carried out to attempt to assess the age of the moon of which we shall write later. For similar gases have been found in lunar soil and the contribution of solar wind to these plays an important part in calculations made.

Direct Observations made by Astronauts

On touch down numerous craters were observed and described. Crater density is practically inversely proportional to size—the smaller the craters the more abundant they are. In the neighbourhood of descent craters ranged from 1 foot to 50 feet across. On a grander scale of course they range to sizes of hundreds of miles in diameter. The interest lies in the report of the smaller features not visible even to the largest telescopes on earth. On landing the engines stirred up a big obscuring stream of surface dust but no lingering cloud was formed. This was to be expected for on the moon which has no gaseous atmosphere to support fine particles the curious situation exists that a small piece of dust falls under gravity just as fast as a great boulder. The familiar dust clouds on earth owe their existence entirely to atmospheric support. In like fashion the astronauts noted later that when they kicked dust it travelled surprisingly far due both to the low gravity (one sixth that

on earth) and to the absence of a resisting atmosphere.

Surface colours were reported to be variants of a chalky grey. Many boulders littered the scene. Most craters had raised rims but none were really sharp edged. A considerable range of rock fragments were noted some being partially hidden in the soil. Over the whole scene was soil looking like powdered graphite. It proved to cling to clothes and implements. Indeed it made the rocks slippery to foothold but it took very firm well retained footprints many of which appear on the surface pictures recorded. The top layer of the soil was distinctly of a lighter grey colour than the rest—the top one inch being quite distinctive. Below this for some 6 inches there was a sand-like zone. Later observation on retrieved material showed that the surface layer was largely microscopic particles. The difference in colour with layering is proof that some kind of surface alteration is going on despite absence of weathering (through absence of atmosphere). Possible causes of this are (i) radiation from the sun (ii) bombardment continuously by micro meteorites (iii) changes due to the expansions and contractions occasioned by the gross temperature differences experienced once a month between lunar night and day.

Examination of Retrieved Rocks

Once the retrieved lunar surface material had passed through the very strictly imposed biological quarantine intensive studies of a considerable range of physical and chemical properties were initiated. Samples were sent for distribution to various laboratories most of which had prepared in advance for the handling of the material. In the event many of the researchers received samples of only 5 g each but despite the relatively small quantities astonishingly complete reports have appeared. Three distinctive types of material were brought back. The first kind was what the geologist calls crystalline igneous rock arising in formation through heat processes. The second kind (widespread on earth) goes by the name of breccia. This is material consisting of small crystal fragments cemented together by a subsequent heating process. The third kind of material (usually called fines) is in effect a soil consisting of quite small particles.

The crystalline igneous rocks appear to be of typical volcanic origin and do not differ outrageously from similar rocks found on the earth. They include many well known earth minerals known to the mineralogists as for example clinopyroxene, plagioclase, ilmenite, olivine and so on. Some native iron is present also. Very few new minerals have been detected although two minor ones appear certain. These include a mineral rich in the metal titanium (it has been named Armalcolite) and a new form of an iron-rich mineral called pyroferroxite. This poverty in new minerals compared with the earth must play its part in later theories about the origin of the moon. They bear on the question of whether the moon was spun off the earth or not.

However a notable very distinctive feature is the presence of a remarkably large quantity of glass on the moon. Glass in a variety of shapes and forms. True some glass is (rarely) found on earth either volcanic in origin or widely distributed in small individual lumps. The small individual lumps of glass found on earth are called *Tektites* but none of the lunar glass at all resembles earth tektite glass. Not only is the lunar glass distributed in spatter lumps but in addition many of the retrieved rocks show numerous small glass lined pits on the surface pits perhaps two millimetres or more across. One obtains the strong impression that the rocks had been shot blasted with many small glass spheres indeed we believe this is actually the case. Furthermore on some rocks there are locally thin glass crusts apparently created by the spatter impact of a larger molten glass globule. Many of the retrieved and observed rocks have rounded edges as though they have been subjected to some erosion process despite lack of atmosphere or weathering. They look, in fact as if they had been rounded by a kind of sand blasting operation. Chemical examination

seems to prove that the glass has been created by direct local melting of the lunar dust and the lunar breccia. However the basic cause of glass formation remains as yet a problem.

One of the really important findings made on the retrieved minerals is that in no case whatsoever were there any crystals present which require *water of crystallization* as part of their structure. All crystals found are what the chemist calls anhydrous. Clearly there is no water at all on the moon and there was none when the surface rocks were created. This finding is obviously closely associated with questions as to whether or not life existed on the moon in the past. Without air without water life as we know it sounds highly improbable.

It is considered by some of the investigators that lunar minerals are more like meteor minerals than earth minerals. Most investigators agree that the Apollo 11 rocks contain appreciably more of the metal titanium than corresponding earth rocks. (This might only be a local factor for the early results of the studies from Apollo 12 differ in this respect. There is less titanium metal than at Apollo 11.) There is plenty of evidence that many of the retrieved lunar minerals have experienced severe shock. When a crystalline material is subjected to severe impact or to a shock wave passing through it from a nearby explosive impact recognizable deformations take place in the crystal structure. Such evidence together with the existence of a great deal of fragmented angular glass imply that the moon's surface has been exposed to a multitude of meteoric impacts large and small in the course of its complex history.

Duplicated chemical analysis shows that more than half of the known elements found on earth occur also in the lunar rock retrieved. This is even more than one could have anticipated from so restricted a region. As yet no new elements have been found. The fact that the surface has been exposed for immense ages to those fast particles from outer space called cosmic rays has created in the surface layers an anticipated degree of radioactivity. This in turn has led to the formation of the atomic products following radio active disintegrations of atoms.

The Age of the Moon's Surface

A number of duplicated attempts of various kinds have been made to assess the *age* of the surface of the moon. There is relatively close agreement between the different approaches. The ages of rocks can be found by various methods the best of these being based on measurements of what are called *isotopic abundances*. An analogy might assist the uninitiated here. Suppose we imagine the existence of identical twins who look alike and behave alike but are slightly different in weight. Indeed such that we can only distinguish one from the other by weighing. A similar situation happens among atoms. Take a metal like lead for instance. There are three main kinds of lead atoms all looking and behaving alike but differing slightly in weight. These three kinds of atoms which require special techniques to distinguish one from the other are called *isotopes* of lead. Practically all types of atoms (whether gases like oxygen, solids like carbon or metals like iron) have several isotopes. Some isotopes are very stable but others are not so stable. They tend to break up after a time and change to other kinds of atoms. Thus we call radioactivity and describe the culprit as a *radio active isotope*. (See also F10-11)

Now the well known metal potassium has an isotope which is weakly radioactive and this converts itself slowly into an isotope of the gas argon. The rate of transformation is very slow but it can be derived with certainty from various rules. If this kind of argon isotope be found in close association with potassium (and it cannot be confused with other kinds of argon) then from the amount present it is possible to calculate how long it has taken for the transformation process to have gone on to accumulate this particular amount. Unfortunately the calculation can be upset by the fact that argon is a gas and may drift away from the rock in which it is created. Also we do know that the solar wind is bringing in argon from

outside. Nevertheless by this method an age for the rocks on the surface of the moon has been calculated to be about *3 000 million years* not in fact very different from the age of earth rocks calculated in similar fashion. Another method of calculation involves the radioactive transformation of an isotope of the metal rubidium (found in moon rock) into an isotope of the metal strontium and this has given the quite near value of *3 700 million years*. Finally the radioactive metal thorium (also in moon rocks) is known to transform itself into the metal lead (see F11(2)) and this method has given *4 000 million years* for the age. So more or less the result from the three methods lies somewhere between about 3 000 and 5 000 million years a relatively close agreement. Since earth rocks are of somewhat similar age this information bears closely on the question of the origin of the moon.

One most significant finding is that the concentration of carbon is quite low i.e. some 200 parts per million. The lunar carbon in this particular region may even be a good deal less than that because we can certainly expect some carbon in the solar wind and in over 3 000 million years the solar wind may have brought in relatively substantial quantities of carbon. Thus very low carbon content has an important influence on theories as to whether or not there has ever been living material on the moon. Although no evidence of such has yet been found one must needs be cautious since all the lunar material retrieved comes from one very small region and elsewhere things could be different.

The Lunar Soil

The returned lunar soil the fine grain material turns out to be of striking and unusual interest. It is grey in colour and a little denser than typical earth soil. It has of course no organic content and is a powdery material which sticks to any thing with which it comes into contact. On the moon the top six inches was easily penetrated after which the soil became more resistant. Microscopic examination of all samples of the returned soil reveals most unexpectedly that perhaps *half* of it consists of finely broken down pieces of glass of varying colours. Included too can be up to a few per cent of finely dispersed free iron. Some of the iron is alloyed with nickel in the typical fashion of iron in meteorites and no doubt this has been brought in by outside meteorites. The existence *today* of free iron shows that it has remained in a completely airless and waterless situation on the moon. The glass fragments are shiny and show no corrosion either. Yet there is certain evidence which does very strongly suggest that there has been some *mechanical* mixing. This could well arise from prolonged repeated impact from a very large number of small meteoric bombardments over the ages. Such bombardments could also have created the glass for glass is molten rock and any energetic impacts could locally raise the temperature to melt surface rock into glass. Succeeding impacts could then break down older glass pieces into tiny fragments if such impacts were repeated often enough. This explanation is supported by the fact that the chemical composition of the soil material resembles that of the surrounding rocks implying that the dust and soil have been created locally and not brought in from outside the moon, as some have thought. As already mentioned there is of course *some* meteoric material also present. Some of the soil brought back has acquired magnetism. The cause is problematic as yet for the moon today has hardly any magnetic field.

Undoubtedly the most striking property of the lunar soil is the presence in it of enormous numbers of small glass spheres (*glass marbles*) and equally huge numbers of glass cylinders, egg shapes, pear shapes and dumbbell shapes. If anything really highlights the special distinctive peculiarity of lunar soil it is these glass objects. Although by weight they only represent a few per cent of the soil mass because of their very smallness they are there in vast numbers. Different kinds of glass spheres abound. Most are less than 1 millimetre across although one of the photo

graphs taken on the moon shows such an object about an inch across (the object itself was not retrieved). Both colour and degree of transparency of the glasses vary. The majority are amber coloured, some are grey and pale greens and blues have also been found. The surfaces of the objects may be shiny and highly specular or they can be coated with a hard dull layer of moon dust. Many objects have internal voids and r. uoles

Chemical analysis shows that increasing depth in colour is usually associated with increasing content of titanium metal. The soil itself also contains angular glassy fragments similar in appearance and composition to the obviously melt formed smooth spherules. Both the irregular grains and the spherules have on occasion free iron entrapped, thus such objects can be picked up with a hand magnet. The range of shapes and forms of the glassy objects is surprising. The writer of this article extracted by hand from a mere 5 g of lunar dust no less than 200 reasonably sized spherules and other shapes merely using tweezers. If this be representative it means there are 40 000 such objects per kg of moon dust. But this is vastly outnumbered by the smaller similar objects easy to see under the microscope which in the writer's sample reach the extraordinary number of 300 000 000 per kg of lunar soil.

Many of the larger spherules have been shown to have once been high speed projectiles on the moon probably having been violently ejected at formation as droplets of molten glass through some fierce impact mechanism. Any satisfactory theory of the origin and formation of the lunar surface will have to account for the glassy spherules. (They are equally abundant at the Apollo 12 site some 500 miles away.) While the larger glass spherules may be splashes from a melt created by impact the tiny ones may have been formed through melting of glass fragments already in the moon dust, the melting having come about through radiation or conduction heating from some nearby meteoric impact event of which there must have been vast numbers.

There is a great deal of past history locked up in the lunar soil and further researches and future lunar retrievals may supply the answers.

PLATE TECTONICS—A DYNAMIC MODEL FOR THE EARTH'S OUTER LAYERS

Over the last few years we have developed a new way of looking at the geology of the earth's surface which gives a much clearer picture than we had before about how such features as ocean basins, continents and mountain chains are related to one another and how the earth's surface has developed during the several thousand million years of geological time. This article will explain first what this new model is and how it works and then describe the evidence that has persuaded most geologists that it does work. To avoid repetition it is assumed that the reader will consult Part I (F5-9) where the basic structure of the earth is described and technical terms explained. It will also be useful to be ready to turn to the Atlas section for maps of the parts of the world under discussion.

Plate Tectonics

The surface of the earth can be divided into a number of plates of lithosphere (see F8) (hence the name for the theory—tectonics means the study of earth movements). These are rigid internally and active only on their edges. They range in size from a few thousand square km to plates the size of North America, South America and half of the Atlantic Ocean taken together. The plates are in constant motion relative to one another so that any boundary between two plates is of one of three kinds: extensional (the plates are moving apart), compressional (they are moving together) and shearing (they are sliding past one another). These boundaries are marked by strings of earthquakes all concentrated in a

narrow zone and these are the main locations of earthquakes, those within the plates being few, scattered and weak. It is at the plate boundaries that geology really happens where dynamic processes take place. The interiors of plates are marked by slow heavings and sinkings and by quiet deposition of sediment or quiet erosion, less dramatic processes by far than are found at the plate boundaries.

Plates Moving Apart

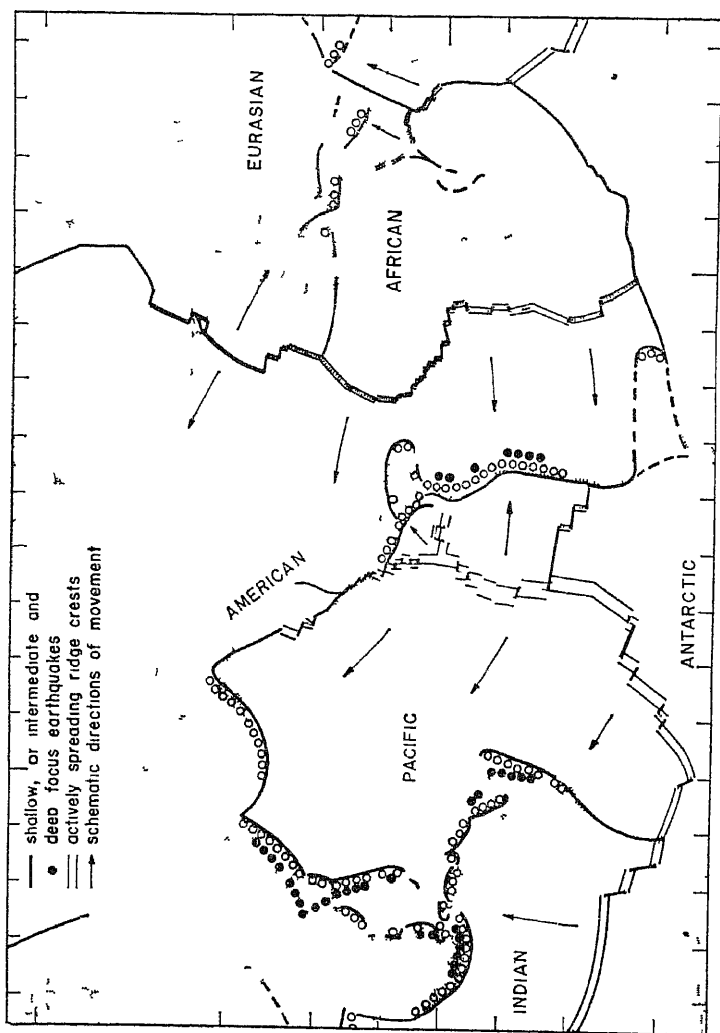

At extensional plate boundaries the plate of lithosphere moves apart, soft mantle material from the asthenosphere (see F8) wells up to fill in the gap. As it rises it partly melts and the lava comes to the surface as a volcanic scum leading to the formation of a line of volcanoes along the plate boundary and resulting in a capping of solidified lava about 5 km thick on top of the cooled and rigid asthenosphere which has now become part of the lithosphere. This crust is the thin ocean crust found everywhere in the deep ocean basins. Extensional plate boundaries thus lead to the formation of new ocean crust and to the increase in area of the ocean basins. Such processes are happening in most of the world's ocean basins where extensional plate boundaries are marked by broad gentle rises such as the Mid-Atlantic Ridge that runs down the centre of the Atlantic Ocean from Iceland to the Azores past Ascension Island and near Tristan da Cunha. Another great rise of this kind runs from the Red Sea through the Gulf of Aden across the Indian Ocean around the south of Australia and New Zealand across the Pacific past Easter Island and the Galapagos ending up in the Gulf of California. Along these rises, and along many smaller ones, the plates are moving apart and creating new ocean crust. Especially interesting are the places such as the Red Sea, the Gulf of Aden and the Gulf of California where continents have been split apart fairly recently (not more than 20 million years ago) and where new oceans are forming. In other places such as Baffin Bay it can be shown that extensional plate boundaries did exist at one time but are now dormant.

Plates Sliding Past One Another

Shearing plate boundaries where plates slide past one another are perhaps the most approachable kind of plate boundary. If the plates on both sides are continental as they sometimes are then shearing plate boundaries are marked by great faults on the earth's surface which can be visited and inspected directly. Such faults are the San Andreas fault of California, the Alpine fault of New Zealand and the North Anatolian fault of Turkey. Along these faults the two plates move inexorably past one another. Where the fault slips well roads, walls and railways running across it are slowly steadily displaced at easily measurable rates of up to 10 cm per year. Parts of these faults stick, though, and in such places the stress in the rocks builds up while the fault does not move. Eventually the stress breaks the blockage with a sudden sharp earthquake which may if the accumulated strain is enough, be immensely destructive. Such an earthquake was the San Francisco earthquake of 1906 and similar earthquakes are associated with most other shearing boundaries.

Plates Moving Together

Compressional plate boundaries where the plates are coming together are more complicated but they have fundamental importance in the development of mountain belts and continents. The best approach is to consider the development of some hypothetical compressional boundary from the time it starts until it stops while drawing parallels with plate boundaries in different stages of development in different parts of the world. Imagine a compressional plate boundary in an ocean basin, so that the crust on both sides of the boundary is oceanic. As compression involves shortening one of the plates is over ridden by the other and the over ridden plate is pushed or

Boundaries of plates superimposed on a map of the world. Extensional boundaries are marked by dotted lines within parallel lines giving a schematic idea of the rate of extension. Compressional boundaries are marked by full lines associated with circles indicating earthquakes. Shearing boundaries are marked by full lines only.

slides down into the mantle. This thrusting involves considerable friction, as might be imagined, and along the descending cold plate is developed a zone of earthquakes that represent fracture of the plate until such depths as it has warmed through enough to be incorporated in the soft asthenosphere. The frictional heating of the ash down going slab causes the ocean crust attached to it to melt and form volcanic lava which rises to the surface to form a chain of volcanoes over the descending plate. In this initial stage then there is an ocean basin containing a chain of volcanic islands (an island arc) outside which is a deep trench marking where the down going plate disappears and a zone of earthquakes (the Benioff zone) extends from the trench under the island arc. Such simple compressional plate boundaries are found in for example the Ryukyu arc between Japan and Formosa, the Caribbean arc in the West Indies, the Aleutian arc in the north Pacific. The next stage in the development of compressional plate boundaries which may not occur for 100 million years or so is that eventually a continent arrives at the boundary being carried on the plate which is being consumed. Now plate tectonics only make sense if we make an assumption here, a reasonable sounding one but one not proved, that continental crust is too thick and too buoyant to be carried down the Benioff plane (i.e. downwards into the mantle) as oceanic crust is carried. At this stage the direction of the downward motion must reverse so that the oceanic crust previously over riding is now over ridden, the island arc becomes welded on to the edge of the continent and a new downward flow forms dipping under the continent. Now there is a deep trench next to the continental margin, a zone of earthquakes reaching under the continent and a line of volcanoes along the edge of the continent. The continent has grown too by the addition of the island arc to its edge. This process happened a few million years ago when New Guinea collided with the Indonesian island arc picked up the arc and reversed the downward flow so that now it dips down under the continental crust of New Guinea. Such a process must also account for the trench along the west coast of South America and the volcanoes in the Andes.

Colliding Continents

Eventually at some still later time a continent approaches carried on the oceanic plate that is now being consumed. This continent will be carrying with it a prism of sediments draped over its edge and on to the nearby ocean crust formed by erosion of the continents and transport of material into the sea. As the two continents meet neither can over ride the other, they collide squeezing up the prism of sediment between them into a mountain chain and becoming welded together. The plate boundary is then destroyed and both plates are joined together into one large one. Such an event is just ending in the Himalayas, where India has collided with Asia. Further in the past Italy collided with Europe to form the Alps and 400 million years or so ago America collided with Europe to form the Caledonian mountain chain, fragments of which are found today from Spitzbergen through Norway, Greenland, Great Britain, Newfoundland and as far south as Georgia. This chain was split apart later by the initiation of an extensional boundary that gave rise to the Atlantic Ocean.

This is essentially how plate tectonics works. It provides a new way of looking at changes taking place now and those that have taken place in the past and gives a framework that relates oceans, mountain chains and continents together as different sides of the same process.

As far as can be estimated at present the rate of creation of new crust at extensional plate boundaries is balanced globally by the rate of destruction of crust at compressional plate boundaries. The surface area of the earth seems to be remaining about the same, but some oceans such as the Atlantic and the Indian Ocean are growing while the Pacific is shrinking. The area of the continents is gradually increasing by the welding on of island arcs to their edges and so the ratio of ocean area to continental area is gradually decreasing. Rates of relative movement between

plates can be measured and appear to be between several millimetres and several centimetres per year. Thus the Atlantic at the latitude of the British Isles is widening at a rate of 2 cm per year (= 20 km per million years).

Evidence for Movement

The evidence that the plates are moving as has been described is rather complex, but some pieces are more easily described than others. The simplest of all is the fit of the continents. Clearly if continents have been split open by extensional plate boundaries, the two edges of the split should match when they are brought together in the direction along which the extensional movement has happened. Such a fit can be demonstrated for the North Atlantic continents: Europe, Scandinavia, Greenland and North America, and most spectacularly for South America and Africa across the South Atlantic. Other fits that have been successful are the two sides of the Red Sea and the Gulf of Aden and those of the Gulf of California.

It is possible by examining the records of the earthquake waves from a single earthquake at a large number of receiving stations at different places to determine the orientation of the fracture in the earth, the fault on which the movement of the earthquake has taken place and the direction of this movement. If plate movement is taking place then the fault orientation and direction of movement on the fault should be consistent with the predicted plate movement. This is found to be the case wherever it is attempted and provides a further piece of evidence.

More technical evidence comes from investigating the earth's magnetic field. Surveys by ships towing magnetometers that measure the strength of the earth's magnetic field from place to place show that parallel to the mid ocean ridge crests the postulated extensional plate boundaries are long linear magnetic anomalies. These are areas in which the magnetic field is either stronger or weaker than is expected and they are caused by the magnetism of the rocks at the bottom of the oceans. The size of the anomalies observed is greater than would be expected from reasonable variations in the magnetic properties of the rocks and their origin was for some years a mystery. However it became clear that the earth's magnetic field had periodically reversed its direction at different times in the past so that the north magnetic pole became the south magnetic pole and vice versa. Measurements of the direction of magnetisation of volcanic lavas together with determination of their ages by their content of radioactive elements enabled a magnetic time scale to be built up showing epochs in which the magnetic field had the same direction as now separated by epochs in which the field was reversed. The lengths of these epochs in the last 5 million years range from a few thousand years to a few hundred thousand years and they fall into a characteristic irregular pattern.

Now if new volcanic crust is being continuously created at extensional plate boundaries then when the magnetic field is in one direction a strip of crust magnetised in that direction will be formed and later when it reverses a strip magnetised in the opposite direction will be formed. So a pattern of strips should result reflecting both the magnetic time scale and the rate of extension at that plate boundary. Comparison of the observed linear magnetic anomalies with calculations based on this model showed that by this means the magnetic anomalies could be accounted for without demanding extraordinary magnetic properties in the ocean floor rocks. The anomaly pattern fits the reversal time scale very closely and is symmetrical on each side of the plate boundary. Thus this is strong evidence that creation of ocean crust at extensional plate boundaries does take place. Conversely it also allows estimates of the rate of extension to be made wherever magnetic surveys over extensional plate boundaries are available by comparing the magnetic anomaly pattern with the reversal time scale. By this means the rate of plate movements can be determined.

Finally there has recently been a series of holes drilled through the sediments in the deep

oceans by the American JOIDES project. This has involved positioning a drilling barge using a ring of engines around its circumference and letting a drill string down through the five or so kilometres of water to the ocean floor where it drills and cores on instructions from the surface. Two main results relevant to the plate tectonics hypothesis have come out of this project. First as would be expected on the hypothesis the oceans are all very young. The oldest sediment so far recovered is no more than 180 million years old while many continents are more than 2 500 million years old. Second a series of holes was drilled across the South Atlantic at points where the magnetic anomalies indicated that the ocean crust was of well defined age if the plate tectonics hypothesis was correct. The holes drilled through the sediments and into the volcanic rocks beneath and in each case the date of the oldest sediment in the hole agreed very closely with the date suggested by the magnetic anomalies for the crust at that site. This was concrete evidence of a kind very different from the inferential evidence of magnetic anomalies, earthquake waves and continental fitting and finally convinced many geologists who had up to then been uncertain that plate tectonics was a reasonable hypothesis and that plate movements are happening. Some remain unconvinced but it is probably true to say that most geologists nowadays are willing to use plate tectonics as at least a working hypothesis.

Mechanisms for Plate Movements

The situation in plate tectonics at the moment is that while most people are convinced that plate tectonics is a useful way of describing the evolution and development of the earth's surface, very few agree on what forces drive the plates, initiate motion and continue it so inexorably over such long periods of time. For some this is an intellectual stumbling block—unless they can be convinced of a mechanism for plate movements they are unwilling to agree that plates can move at all. But it is difficult to justify this point of view. The same people find no difficulty in using the Law of Gravitation even though it is not at all clear how gravity works or why it works in the way it does. However the search for a mechanism has a certain fascination and should be touched on for the sake of completeness.

Mechanisms proposed so far fall essentially into three classes: convection currents pushing mechanisms and pulling mechanisms. The convection current hypothesis holds that the mantle of the earth is stirred by slow moving convection currents and that these are directly or indirectly responsible for plate movements. Although the transfer of material in plate movements is rather like convection, with hot material coming up at extensional boundaries and cold material going down at compressional boundaries, the shape of the plates is unlike any reasonable convection flow pattern and other difficulties are also found. Pushing mechanisms suppose that plates are elevated by expansion in the mantle at extensional boundaries and then slide off sideways pushing the rest of the plate ahead. Pulling mechanisms on the other hand postulate that as the ocean crust slides down the Benioff zone at converging boundaries it becomes transformed to a very dense material which then sinks pulling the rest of the plate after it.

All of these mechanisms are unsatisfactory in one way or another. Possibly the answer lies in some combination of them or perhaps in some mechanism yet to be thought of. There does appear however to be general agreement that the only source for the energy necessary to move the plates is the heat of the earth's interior and as this becomes better understood the mechanisms should become clear.

MUSEUMS OF SCIENCE AND TECHNOLOGY

Aims, Possibilities and Problems

A museum has no purpose which is not ultimately educational and the basic philosophy of a museum man must include the belief that the

study of what other people have done and are doing stimulates the intellect and the imagination and provides surpasts (and no entry signs) along the way of a creative life. If such a philosophy seems at variance with some current educational theory which lays stress on discovering for oneself rather than on learning by the experience of others and also seems to ignore the marked preference of the young for making their own mistakes then the museum man must fortify himself by studying the attendance figures. He will find that museums are becoming more popular every year.

It is difficult to discern any trends towards particular types of collections in this increasing popularity. In London the Science Museum draws the largest attendance but it has done so for a long time and there is no sign that there has been a swing away from the Art museums. There is no evidence that increasing popularity is a result of museums being better than they were. Drab unmodernised galleries are quite as well filled as some colourful and spacious ones and the Pitti Palace in Florence demonstrates that crowds will still come to a picture gallery where half the pictures on display simply cannot be seen. To a museum man the present situation presents an opportunity rather than a cause for self congratulation.

Museums of science and technology are in one respect better placed than art museums or museums of local history when it comes to educating this large and variously motivated public. The things they display not only need interpretation but can be seen to need it. The Science Museum has a century old tradition of long and learned labels, the first paragraphs of which may suffice for the less curious and are devised to do so while the full extent may even finish with suggestions for further reading. These long labels are sometimes criticised for being aimed at a very small minority of visitors or on the general ground that a label cannot be devised to suit a wide variety of types of readers or (perhaps most often) for spoiling the look of the display. There is something in all of these criticisms but they are more likely to be met by more and better labels than by reducing these to the level of descriptiveness typified by the time honoured phrases 'primitive passerine bird' or 'Flemish 15th cent'.

Museum Education Departments

It is not surprising that among our national museums the Science Museum and the Natural History Museum should have the busiest education departments concerned with the exploitation of the museum collections for purposes of formal education. Both museums deal largely with subjects which figure in school and university curricula. In the Science Museum a noticeable consequence of the broadening of educational minds in recent years is the large demand for tours and lectures for history students and also the frequent requests for lectures on light, colour, materials and design for art students. This last illustrates the kind of useful extra-curricular activity which becomes possible when the museum education department has a high reputation and a firm base of regular demand upon which to build. The assurance of a large clientèle makes it worth while to arrange special series of lectures for older children given by invited lecturers from industrial or university research departments. It is also possible to arrange a regular programme of scientific films and to offer the general public a range of entertainments on a far more lavish scale than would otherwise be justified.

The growth of the education service in the Science Museum has almost certainly been due to difficulties within the schools. There have been shortages of qualified teachers and of equipment. These shortages have persisted and even grown worse while science itself has advanced faster than before. This is a situation in which one museum however great can do very little even though it is exploring ways of spreading its influence by publications by opening its galleries to the television teams by training teachers and staff for other museums. It is quite clear that every scientific museum in the country including general

museums with considerable scientific technological or industrial collections could find work to do in this field.

One important point must be stressed. The education department must not be a poor relation within the museum grudgingly afforded a little unused space and staffed by seconded teachers widely regarded as unwelcome by the rest of the staff. Such has been the case occasionally in the past but where the job to be done is of such importance it must be done by people of high intellectual calibre whose role in the museum is not merely that of exploiters but no less that of advisers. These are the people who will have the greatest contact with the thoughtful visitors of all ages and who will represent the management of the museum in the eyes of most of its public. Their ideas for the improvement of the collections will come from their practical experience of the value of those collections to the most interested people and their knowledge of the subjects will be enriched by contact with many visitors who have specialised knowledge of those subjects.

What Do the Visitors Want?

Even in the Science Museum group visits account for less than 10% of total attendance. It would be extremely difficult to do a statistical analysis of the motivations of the rest and it has not been attempted. Some indications have been given by casual visitors to public lectures on Saturday afternoons. As these represent perhaps 2% of visitors on that day and a probably unrepresentative sample at that undue importance cannot be attached to what they said but at least over some years these people have given answers conforming to the same pattern.

There were always a few who had come specially to attend the lecture because they were interested in the subject. They were invariably people who had visited the museum before most of them frequently. All the rest had come to the lecture because they were in the museum and had seen the lecture publicised within the building. The question then put was why had they come to the museum? The rather vague answers provided by this predominantly adult set of people suggested that almost all had been before and thought the museum a splendid place. About a third had an evident desire to increase their store of knowledge. The rest simply wished to experience pleasure of a not very intellectual kind by seeing things of beauty (which are not the sole prerogative of art museums) by seeing other people by enjoying the comforting sensations of man's greatness and even by feeding national pride. Such motives are not to be despised and would suffice for poets novelists and even painters but a curious point is that very few of these people made a habit of visiting art museums whereas among the more purposeful third this was quite common.

A possible reason for the popularity of the Science Museum and of other museums such as the Museum of British Transport with relatively unmotivated visitors is that such museums approach history or science or art via the workaday world in which they feel at ease and able to contribute some understanding. The art museums start right at the top with what are usually the products of an élite for an élite and on the assumption that we needs must love the highest when we see it devote more care to presentation than to interpretation. The result is often a good deal of public embarrassment. Even though this division of museums into two kinds is an absurd oversimplification it remains true that practically everything in any museum can be made more accessible to the public by treating it as if it were a scientific mystery rather than a self-evident masterpiece.

Organisation of Collections

The smaller the museum the smaller the problem when it comes to organisation of collections but the greater the challenge of trying to turn scraps of information into a body of knowledge for the visitor to acquire. No fact contributes to knowledge if it stands alone and a small scientific

collection requires contextual material if it is to engage the attention of any but the most informed and dedicated student. Many small museums have specialised collections of scientific material often the gift of a local collector of notability. It is easy to see how such a collection of for instance early photographs and equipment can be vitalised by putting it in the context of the history of photography certainly but also of optics of photochemistry and of art and by aiming eventually to include cinematography and such aspects as photolithography. In this way even a single collection can enhance its value to the casual or purposeful visitor immeasurably.

The aim of a small museum in the scientific field should be in some way to expand because there is virtue in sheer size and variety. This adds the element of comparison to that of context and so increases the intellectual stimulus but of course it increases the problems of organisation and of interpretation. The extreme example of this is the Science Museum where the richness of the collections makes it possible to put most of the objects into several different contexts. However only one basic set of references can be used for the physical layout of the galleries so the museum is arranged according to some fifty subject divisions. Even these require some duplication of material.

It is perhaps in unravelling another fifty subjects from the same material that the education service performs a task peculiarly its own. These subjects are partly perfectly obvious academic type ones such as electronics kinematics or wave mechanics and lead the student (of electronics for example) through collections labelled Atomic Physics Radio and Television X Rays Navigation Time Measurement and Mathematics. They may deal with particular materials such as rubber or plastics or with periods of history. Ideally a museum of great size should have ways of referring its visitors to all these paths of knowledge which lead over many different fields preferably by means of publications but perhaps also by means of large photographic displays.

A museum which is not too large or too crowded and which takes its educational function seriously might well dispense entirely with the practice of imposing a logical physical organisation on its collections. The assumption would have to be made that every visitor would be equipped with the particular guide to suit his requirements. It could be argued that it is more economic to print more guides than to attempt to coax awkward material into possibly unpractical juxtapositions. The advantage from the point of view of display and of convenience within the building would be great but the intellectual advantage might be still greater. It is becoming increasingly important that young scientists and engineers should not be trained to think along the lines of a single subject or part of a subject but should be aware of the possibility of other ways of thinking. Not only will this make them better scientists in the first place—it will also equip them better to reapply their scientific training in another field should this be necessary.

Types of Exhibit

A particular difficulty confronting museums of science and technology is the extraordinary variety and extreme range of size of their objects on view. A locomotive may weigh 100 tons and an insect be only visible through a microscope. This immediately poses the question of whether a model of the locomotive would not do as well or a microphotograph of the insect. The answer to this is no but in some cases it is only no by a narrow margin. It depends upon the visitor. There is a type of visitor who comes to a museum especially to see the real thing. In the case of the insect reality is already once removed by the microscope but it is still worth while to display one or two in this way and to back them up with a large collection of photographs of other varieties. In the case of the locomotive size is of its essence too and its beauty (or ugliness) is partly scale dependent as is all beauty. Its relationship to the men that handled it and crawled about it is historical evidence and its technology is far more readily grasped in the full size. Finally at the present time it can be obtained for about half the price of a

fine quality model (and if a museum model is not of fine quality it is useless).

There is a type of museum exhibit which is not a proper museum piece at all but a didactic display or demonstration. One way of using such material is to explain an adjacent museum piece. This is really an extension of the label. The other way of using such demonstration pieces is to arrange a series of them as a complete lesson in some subject. This has been done quite admirably in some museums but it can be best done in a lecture theatre with a lecturer who can answer questions. Unless a museum is built specially as a teaching tool this kind of thing should be planned to put the museum pieces proper into context.

Inevitably museum pieces will mean different things to different people. A piece of eighteenth century apparatus—a Herschel telescope perhaps—will be an optical instrument to some, a personal relic of a great man to others, a symbol of astronomical discovery, a piece of elegant furniture, or an interesting example of a mechanical handling device to others again. It is all those things and its presentation and labelling should at least not obscure any of its qualities. Museum objects sometimes reveal fresh qualities when modern developments make the ideas behind them appear prophetic. Exactly this has happened to Babages calculating machines in the Science Museum now seen as the intellectual forerunners of the electronic computer.

A recurring anxiety of the museum man in the scientific field is: how up to date can we be? A small specialised museum should try to keep pace with developments in its field even though this may involve discarding material which eventually proves to have been of ephemeral interest. The public will expect this of the museum. But for an establishment of the size of the Science Museum this is simply impossible. It must be highly selective in its choice of topicalities, not only in trying to judge their long term significance but equally in judging their essential suitability for museum treatment. As an example organ transplant operations though highly topical recently simply do not lend themselves to museum display.

What Should the Public Think?

This is the question the museum man should not ask. The museum should present facts. If it cannot avoid opinions then alternative theories must be aired. The museum should not try to impose an itinerary on its visitors or do anything to make a visit less happy for those who come to browse to make their own discoveries to watch the children or admire the architecture. The public must feel at home and welcome.

The museum authorities should make sure that the discoveries are there to be made. They should open up many inviting paths of investigation as possible. The paths should be there and maps should be on sale. The evidence should be on display. If any attempt is made to go beyond this the public will cease to enjoy the museum.

Science Museums and the Others

Art museums are full of obviously beautiful things. Historical museums are often enlivened by reconstructed period rooms, bright costumes and amusing by-gones. Museums of science and technology are less well endowed superficially in these respects. Therefore their display techniques need to be very advanced. Generally the objects look best by being well lit and austere presented, but the rooms or galleries require very careful treatment to give the impression of an agreeable place to be in with a little curiosity about what is round the corner but no sense of being hurriedly drawn on. It is better for the visitor to come again than to feel he has to see it all. In the Science Museum there is no chance that he will ever see it all—it would be a full time job for two years.

The staff of a scientific museum should hope that their visitors visit other museums as well. From textile machinery to woven fabrics is a natural enough progression as from chemistry to cere-

mics. The arts cannot be properly understood without the sciences and every artist or craftsman is a technologist too. The visitor who looks at Victorian furniture in one museum and at a Victorian locomotive in another may well decide that the locomotive is the more artistic.

Ultimately all museums which are not solely devoted to natural history are museums of human ideas. As such they have similarities greater than their differences.

GRAMOPHONE RECORDS PAST AND PRESENT

Preamble

For countless centuries man has sought to make permanent records of his emotions and of the events that have encompassed him. By way of the graphic and tactile arts at first crude and sketchy but later touching the heights of master piece and by way of the critical achievement of learning to write man has evolved means of communicating not only with his contemporaries but with future generations also. With time the earlier technologies of painting oils and printing inks of engraving and casting led to the more modern one of photography, the still and the movies. All these developments over aeons of time had one feature in common: they were silent. Even the sheet of music was in some respects no more than the transcript of a speech, a set of instructions for the musician to produce his own version of the composer's first performance as best he could.

Not surprising then that during the latter half of the nineteenth century many inventors sought to make permanent records of actual sounds—speech as uttered, music as performed and songs sung. The concept was essentially the making of a sound record which could be caused to reproduce the original sound.

Acoustic Recording

The first fifty years or thereabouts of such recording was the era of acoustic recording. The name not a very happy one refers to the use of a direct mechanical linkage between a receptor for the incident sound—invariably a horn terminating in a diaphragm—the latter performing the same function as the ear drum in that it vibrates in sympathy with the sound pressure vibrations—and a small pointed or chisel ended tool the purpose of which is to cut or to indent the surface of the recording medium. The process of converting a quantity of one kind in this case an alternating acoustic pressure into another in this case a mechanical vibration is termed transduction. In the ideal transducer the changes and variations in its output (the mechanical vibration) are exactly in unison with the changes and variations of its input (the pressure alternation).

Mary Had a Little Lamb the Phonograph.

All acoustic recording machines made use of such an acoustic mechanical transducer in one form or another. Of these precursors of the modern gramophone the earliest which was in any sense commercially viable was that developed in the U.S.A. by Edison in 1877-8 arising from an earlier experimental apparatus of his into which he had spoken and reproduced a nursery rhyme.

Edison's machine was the Phonograph in which the cutting tool, a ball tipped stylus, bore on to a wax cylinder. The cylinder was rotated (by hand originally later by a clockwork mechanism) and the stylus vibrated in an up and down direction so as to indent the wax. Because the wax surface was in motion it was indented more or less deeply by the stylus to give an undulating track. This mode of recording named technically vertical displacement recording is often referred to more evocatively as hill and dale recording. To produce the sound which initiated the indentations it was necessary to reverse the function of the transducer. This was done by setting the stylus back to the commencement of the track it had made and by rotating the

cylinder once more. The track itself was made to form a spiral on the surface of the cylinder by attaching the horn and stylus to a lead screw arrangement identical in principle to that of a screw cutting lathe.

The Gramophone Proper

One very serious limitation of the Edison machine was that although it made a permanent if crude recording this recording could not be duplicated or copied. In present day jargon each recording was a one off. Fortunately for the gramophone there was an almost concurrent introduction of Berliner's Gramophone. This used a transducer similar to that of the Phonograph but there were important differences. The rotating element was not a cylinder but a disc the stylus moved sideways not up and down so as to make a lateral displacement recording rather than a vertical one and the recording medium the disc was of wax coated zinc.

The way was now clear to copy recordings using a technique borrowed from the electrotype trade: the recorded disc was coated with graphite and then thickly electroplated. When the electroplate was peeled off it did of course carry the groove pattern in relief so that it could be used as a die by means of which copy recordings could be pressed. In essence this is the way in which recordings are copied today although many refinements to ensure exact copying have been developed. Many curious recipes were at first used for the pressing material which eventually emerged as one of several mixes of three main ingredients: shellac lamp black as a lubricant and a filler such as slate or mica dust. The mixture was necessarily thermoplastic albeit made up of natural compounds in order that it could be pressed while hot and soft.

Progress could now be made to improve the basic inventions: better spring drive motors to give more constant pitch to the recorded sound (spurious pitch variations are referred to also evocatively as wow and flutter) changes in the mix of materials used for the pressings so as to reduce both the background noise or needle hiss and also the wear and many substantial improvements in the transducers.

Since the copy recording or pressing could now be played on a separate machine it was possible to design one transducer—the cutter head—to cut the master recording and another—called the sound box—to replay the pressings. Much inventive talent was expended in the design of these transducers and their associated acoustic horns.

"Electric Recordings"

The crucial limit to indefinite improvement was the fact that in the recording process all the work done in displacing the cutting stylus had to be carried out by the sound wave. Similarly on replay the force necessary to actuate the diaphragm of the sound box had to be transmitted (from the driving motor) via the walls of the groove and the needle. All this militated against refinements of design which could yield better high frequency response lower non-linearity distortion and reduced pressures at the needle tip. However by the mid nineteen twenties the technology of electronics was exploding: the radio valve was being developed and exploited for all communication purposes so that in 1924 a new form of cutter head was invented by Maxfield and Harrison. It was essentially an electro-magnetically operated stylus wherein a varying electrical current rather than a sound wave caused the stylus to vibrate. This was an electro-mechanical transducer and so a second transducer an acoustic electrical one was necessary. The latter already existed as the microphone: the electrical output from which could be magnified by a valve amplifier before it was fed to the cutter head.

Electric recordings as they were called by the ad men facilitated another large improvement in recording quality. The microphone was a comparatively small design problem on the acoustical side and once it had turned the sound waves into

corresponding electrical currents the forces required by the cutting stylus however large could be provided by way of the recording amplifier. Furthermore it became simple to make the degree of amplification or gain depend on the sound frequency so as to compensate for deficiencies in for example the cutter head or microphone.

Electrical Pick ups

Within the next decade by the mid thirties the equivalent of the electrical sound box—the gramophone pick up—had also come into common use. This transduced the mechanical vibrations of the needle into electrical signals which could be amplified and thence made audible in a loudspeaker. Its impact on quality of reproduction was dramatic. The use of frequency dependent gain could be further extended not only to correct for deficiencies but also to record and replay over a much wider spectrum of frequencies. Hitherto it had not been practicable to reproduce sound much lower in pitch than about the octave below middle C. Primarily this was because in order to reproduce a sound pressure which is constant at every frequency (in order to give a constant sound intensity) the lateral displacement or sideways movement of the stylus must be inversely proportional to frequency. Therein is a fact of acoustical life and if this inverse frequency law were applied rigorously it would follow that as the pitch of a sound is lowered groove displacement would have to increase in proportion. That is for each octave reduction in frequency the groove displacement must double! If the low frequencies were not selectively attenuated during recording one groove would break into its neighbours on fortissimo passages unless the groove spacing were to be unacceptably coarse. Indeed the choice of groove spacing was and to some extent remains a compromise between groove isolation and length of playing time. So the bass frequencies were attenuated during the recording process and whereas with acoustic replay there was virtually no simple way of recovering them the electrical replay chain could be compensated (equalised) to give extra amplification to the low frequencies and thus make good the deficiencies in the low notes.

For the reason explained above the weight borne by the needle of a sound box was necessarily large—often many hundreds of grammes. The pick up with its succeeding amplifier could do much better than this since its needle did not have to move a diaphragm and a large mass of air. Early pick ups tracked with a playing weight of 10-30 g and today a weight of 5 g would be thought excessive 0.5-2 g being usual.

Again reducing the demand for work to be done by the moving parts of the pick up meant that these could be very much smaller lighter and more freely moving. These reductions in both effective mass and stiffness in turn made it possible and indeed desirable to abandon the traditional needle replacing it by a minute jewelled tip attached directly to the moving part of the transducer. The stylus is then capable of tracing the groove pattern at much shorter wavelengths (higher frequencies) than hitherto. In early days of electrical recording the highest recorded frequency was probably not much greater than 4 kHz (3 octaves above middle C) at the inner part of a 78 rpm disc the wavelength is then about 20 micrometres or 5 thousandths of an inch. Today despite the reduced turntable speeds the upper limit of recording is usually not less than 16 kHz the concomitant wavelength near the inner grooves of a 33½ rpm record being less than 3 micrometres or 0.7 thousandths of an inch.

f i r

By the mid 1940s the limit of the traditional shellac base pressing had been reached with the introduction of the Decca full frequency range recordings. These incorporated a somewhat smaller groove than normal to improve short wavelength tracing a degree of high frequency pre-emphasis whereby the higher frequencies

are relatively increased or emphasised during recording so allowing a corresponding de-emphasis to be arranged for in the replay amplifier to reduce needle hiss. A variable pitch* recording such that on loud passages the groove spacing is automatically increased thereby allowing some relaxation of the need to compress the dynamic range and a modified bass characteristic. These measures produced a worthwhile gain in record quality but they were within two years to be followed by a comprehensive re-think on the conventional 78 rpm shellac disc.

(*The word pitch above is ambiguous in the disc recording context. It can refer to the physical concomitant of frequency or as here to the number of grooves per inch of radius by analogy to screw threads the pitch of which is the distance between adjacent turns of the thread.)

1 p

This re-appraisal exercise was carried out by Goldmark of the American Columbia Company. Its object was to increase the playing time of the disc so as to minimise the need for breaks in the reproduction of most classical music and to lessen one of the principal remaining limitations of the disc recording—the need to restrict the range of loudness that could be handled—a limitation known as compressing the dynamic range. Compare an early pre-1 p recording with a recent version of the same work and observe how in the earlier recording the loud passages are held in check and the soft passages rendered less so. This is volume compression in action necessary to overcome groove jumping on the fortissimo and to ride the signal above the surface noise at the pianissimo end of the loudness scale.

The outcome of Goldmark's work was introduced as the Microgroove recording now simply referred to as the 1 p or long playing record. The immediate step towards longer playing time is speed reduction and this was effected by making the speed 33½ rpm instead of 78 rpm a time gain of 2.3. Speed reduction however carries with it the penalty of shorter wave lengths. To make these more readily traceable by the stylus the groove profile was considerably reduced in size. It called for a new standard in stylus profiles also. The stylus for the 78 rpm disc had terminated in a spheroidal tip of radius 2.5–3.0 thousandths of an inch. The new stylus had tips of radius not more than 1 thousandth inch. A bonus of the smaller groove was that more grooves per inch could be cut yielding a further useful increase in playing time which in the event increased from about 4 minutes to about 20 minutes for a 12 inch disc a time improvement of 5.

Shorter wavelengths even if they are made traceable exacerbate the surface noise problem because the desired deviations of groove become more comparable with the undesired irregularities stemming from the granularity of the mix. So the shellac/carbon black/filler formulae were abandoned to be replaced by a modern synthetic thermoplastic a co-polymer of polyvinyl acetate and polyvinyl chloride (F24(1)). The polymerised vinyls are at once smoother more friction free and less brittle than the traditional mixes. Their use particularly if associated with the lubricant lamp black and a non granular filler not only improves the wear properties but most importantly reduces the surface noise many times sufficiently that there could be a downward extension of recording level on quiet parts of the programme to the benefit of the dynamic range. Variable pitch recording and 1 p pre-emphasis were perpetuated.

In total these substantial changes to the gramophone record yielded the following improvements:

- increased playing time
- reduced tracing distortion
- increased dynamic range
- somewhat improved frequency range
- reduced needle hiss
- reduced breakage rate

It is true that 1 p discs are somewhat more vulnerable to the careless finger nail or the dropped pick up that they readily acquire an electro-

static charge which attracts dust particles and that dust is more offensive in the microgroove than in the standard groove. But the achievement of their introduction was hardly less significant than the inception of electric recording itself.

As a postscript to this short account of the 1 p disc the 45 rpm record should be mentioned. It emerged from the Radio Corporation of America a year after the Columbia innovation. It used a similar fine groove and was pressed from similar material. Its speed was technically slightly better than that of the 1 p disc and its thickened centre its very large bore and its 7 inch diameter were all tailored to suit a novel automatic record changer with a simple cheap and extremely rapid change mechanism. It offered an alternative approach to the long play problem. The record changer has long since gone out of production but the discs persist as a medium for short programmes notably of the pop kind.

"Stereo"

The possibilities of the 1 p record and modern pick ups were further exploited during the 1950s when more or less successful attempts were made to diffuse the concentrated source of sound which a single loudspeaker represents. The name given to these ventures is stereophony and the object is to simulate the distributed source formed by a group of musicians a stage of actors and so on by a limited number of independent signal channels each terminating in one or more loudspeakers.
